region of mRNA encoded by LOC254826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254826 BINDING SITE, designated SEQ ID:46435, to the nucleotide sequence of VGAM2139 RNA, herein designated VGAM RNA, also designated SEQ ID:4850.

[74124] Another function of VGAM2139 is therefore inhibition of LOC254826 (Accession XM_173188). Accordingly, utilities of VGAM2139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254826. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2140 (VGAM2140) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74125] VGAM2140 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2140 was detected is described hereinabove with reference to Figs. 1-8.

[74126] VGAM2140 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Ectromelia Virus. VGAM2140 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74127] VGAM2140 gene encodes a VGAM2140 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2140 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2140 precursor RNA is designated SEQ ID:2126, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2126 is located at position 172080 relative to the genome of Ectromelia Virus.

[74128] VGAM2140 precursor RNA folds onto itself, forming VGAM2140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74129] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2140 folded precursor RNA into VGAM2140 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2140 RNA is designated SEQ ID:4851, and is provided hereinbelow with reference to the sequence listing part.

[74130] VGAM2140 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2140 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2140 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74131] VGAM2140 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2140 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2140 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2140 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2140 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74132] The complementary binding of VGAM2140 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2140 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2140

host target RNA into VGAM2140 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74133] It is appreciated that VGAM2140 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2140 host target genes. The mRNA of each one of this plurality of VGAM2140 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2140 RNA, herein designated VGAM RNA, and which when bound by VGAM2140 RNA causes inhibition of translation of respective one or more VGAM2140 host target proteins.

[74134] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2140 gene, herein designated VGAM GENE, on one or more VGAM2140 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74135] It is yet further appreciated that a function of VGAM2140 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2140 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2140 correlate with, and may be deduced from, the identity of the host target genes which VGAM2140 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74136] Nucleotide sequences of the VGAM2140 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2140 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2140 are further

described hereinbelow with reference to Table 1.

[74137] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2140 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2140 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74138] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2140 gene, herein designated VGAM is inhibition of expression of VGAM2140 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2140 correlate with, and may be deduced from, the identity of the target genes which VGAM2140 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74139] Bromodomain Adjacent to Zinc Finger Domain, 1A (BAZ1A, Accession NM_013448) is a VGAM2140 host target gene. BAZ1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAZ1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of BAZ1A BINDING SITE, designated SEQ ID:15115, to the nucleotide sequence of VGAM2140 RNA, herein designated VGAM RNA, also designated SEQ ID:4851.

[74140] A function of VGAM2140 is therefore inhibition of Bromodomain Adjacent to Zinc Finger Domain, 1A (BAZ1A, Accession NM_013448), a gene which acts as a chromatin-mediated transcriptional regulator. Accordingly, utilities of VGAM2140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ1A. The function of BAZ1A has been established by previous studies. Bochar et al. (2000) purified a chromatin-remodeling complex, which they called WCRF, from HeLa nuclear extracts. The purified complex contains 2 proteins, BAZ1A at 180 kD, which they designated WCRF180, and SMARCA5 (OMIM Ref. No. 603375), which they designated WCRF135. Using in vitro ATP-dependent DNase I cleavage of mononucleosomes, they confirmed an ATP-dependent chromatin remodeling activity in the complex. Poot et al. (2000) identified BAZ1A, which they designated ACF1, within a chromatin remodeling complex, CHRAC, purified from HeLa cell nuclear extracts. They confirmed an interaction between BAZ1A and SNF2H

(SMARCA5). Two small histone-fold proteins, CHRAC17 (POLE3; 607267) and CHRAC15 (CHRAC1; 607268), copurified with the complex, and the authors showed that these proteins form a DNA-binding heterodimer. Poot et al. (2000) determined that the purified complex could mobilize nucleosomes into a regularly spaced nucleosomal array and that the spacing activity was strictly ATP-dependent.

[74141] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[74142] Bochar, D. A.; Savard, J.; Wang, W.; Lafleur, D. W.; Moore, P.; Cote, J.; Shiekhattar, R. : A family of chromatin remodeling factors related to Williams syndrome transcription factor. Proc. Nat. Acad. Sci. 97: 1038-1043, 2000. ; and

[74143] Poot, R. A.; Dellaire, G.; Hulsmann, B. B.; Grimaldi, M. A.; Corona, D. F. V.; Becker, P. B.; Bickmore, W. A.; Varga-Weisz, P. D. : HuCHRAC, a human ISWI chromatin remodelling complex.

[74144] Further studies establishing the function and utilities of BAZ1A are found in John Hopkins OMIM database record ID 605680, and in sited publications numbered 507 and 5074 listed in the bibliography section hereinbelow, which

are also hereby incorporated by reference.APCL (Accession NM_005883) is another VGAM2140 host target gene. APCL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APCL BINDING SITE, designated SEQ ID:12503, to the nucleotide sequence of VGAM2140 RNA, herein designated VGAM RNA, also designated SEQ ID:4851.

[74145] Another function of VGAM2140 is therefore inhibition of APCL (Accession NM_005883). Accordingly, utilities of VGAM2140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APCL. P5-1 (Accession NM_006674) is another VGAM2140 host target gene. P5-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P5-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P5-1 BINDING SITE, designated SEQ ID:13497, to the nucleotide sequence of VGAM2140 RNA, herein designated VGAM RNA, also designated SEQ

ID:4851.

[74146] Another function of VGAM2140 is therefore inhibition of P5-1 (Accession NM_006674). Accordingly, utilities of VGAM2140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P5-1. LOC91286 (Accession XM_037444) is another VGAM2140 host target gene. LOC91286 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91286 BINDING SITE, designated SEQ ID:32623, to the nucleotide sequence of VGAM2140 RNA, herein designated VGAM RNA, also designated SEQ ID:4851.

[74147] Another function of VGAM2140 is therefore inhibition of LOC91286 (Accession XM_037444). Accordingly, utilities of VGAM2140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91286. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2141 (VGAM2141) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74148] VGAM2141 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2141 was detected is described hereinabove with reference to Figs. 1-8.

[74149] VGAM2141 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2141 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74150] VGAM2141 gene encodes a VGAM2141 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2141 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2141 precursor RNA is designated SEQ ID:2127, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2127 is located at position 169712 relative to the genome of Ectromelia Virus.

[74151] VGAM2141 precursor RNA folds onto itself, forming

VGAM2141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74152] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2141 folded precursor RNA into VGAM2141 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2141 RNA is designated SEQ ID:4852, and is provided hereinbelow with reference to the sequence listing part.

[74153] VGAM2141 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2141 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2141 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74154] VGAM2141 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2141 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2141 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2141 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2141 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74155] The complementary binding of VGAM2141 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2141 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2141 host target RNA into VGAM2141 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74156] It is appreciated that VGAM2141 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2141 host target genes. The mRNA of each one of this plurality of VGAM2141 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2141 RNA, herein designated VGAM RNA, and which when bound by VGAM2141 RNA causes inhibition of translation of respective one or more VGAM2141 host target proteins.

[74157] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2141 gene, herein designated VGAM GENE, on one or more VGAM2141 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74158] It is yet further appreciated that a function of VGAM2141 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2141 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2141 correlate with, and may be deduced from, the identity of the host target genes which VGAM2141 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[74159] Nucleotide sequences of the VGAM2141 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2141 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2141 are further described hereinbelow with reference to Table 1.

[74160] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2141 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2141 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74161] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2141 gene, herein designated VGAM is inhibition of expression of VGAM2141 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2141 correlate with, and may be deduced from, the identity of the target genes which VGAM2141 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[74162] ESDN (Accession NM_080927) is a VGAM2141 host target gene. ESDN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESDN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESDN BINDING SITE, designated SEQ ID:28151, to the nucleotide sequence of VGAM2141 RNA, herein designated VGAM RNA, also designated SEQ ID:4852.

[74163] A function of VGAM2141 is therefore inhibition of ESDN (Accession NM_080927). Accordingly, utilities of VGAM2141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESDN. KIAA1317 (Accession XM_098368) is another VGAM2141 host target gene. KIAA1317 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:41631, to the nucleotide sequence of VGAM2141 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4852.

[74164] Another function of VGAM2141 is therefore inhibition of KIAA1317 (Accession XM_098368). Accordingly, utilities of VGAM2141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1317. LOC158295 (Accession XM_098915) is another VGAM2141 host target gene. LOC158295 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158295 BINDING SITE, designated SEQ ID:41939, to the nucleotide sequence of VGAM2141 RNA, herein designated VGAM RNA, also designated SEQ ID:4852.

[74165] Another function of VGAM2141 is therefore inhibition of LOC158295 (Accession XM_098915). Accordingly, utilities of VGAM2141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158295. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2142 (VGAM2142) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74166] VGAM2142 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2142 was detected is described hereinabove with reference to Figs. 1-8.

[74167] VGAM2142 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2142 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74168] VGAM2142 gene encodes a VGAM2142 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2142 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2142 precursor RNA is designated SEQ ID:2128, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2128 is located at position 168447 relative to the genome of Ectromelia Virus.

[74169] VGAM2142 precursor RNA folds onto itself, forming

VGAM2142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74170] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2142 folded precursor RNA into VGAM2142 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2142 RNA is designated SEQ ID:4853, and is provided hereinbelow with reference to the sequence listing part.

[74171] VGAM2142 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2142 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2142 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74172] VGAM2142 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2142 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2142 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2142 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2142 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74173] The complementary binding of VGAM2142 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2142 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2142 host target RNA into VGAM2142 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74174] It is appreciated that VGAM2142 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2142 host target genes. The mRNA of each one of this plurality of VGAM2142 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2142 RNA, herein designated VGAM RNA, and which when bound by VGAM2142 RNA causes inhibition of translation of respective one or more VGAM2142 host target proteins.

[74175] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2142 gene, herein designated VGAM GENE, on one or more VGAM2142 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74176] It is yet further appreciated that a function of VGAM2142 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2142 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2142 correlate with, and may be deduced from, the identity of the host target genes which VGAM2142 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[74177] Nucleotide sequences of the VGAM2142 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2142 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2142 are further described hereinbelow with reference to Table 1.

[74178] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2142 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2142 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74179] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2142 gene, herein designated VGAM is inhibition of expression of VGAM2142 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2142 correlate with, and may be deduced from, the identity of the target genes which VGAM2142 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[74180] Dihydrolipoamide Branched Chain Transacylase (E2 component of branched chain keto acid dehydrogenase complex; maple syrup urine disease) (DBT, Accession NM_001918) is a VGAM2142 host target gene. DBT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DBT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBT BINDING SITE, designated SEQ ID:7634, to the nucleotide sequence of VGAM2142 RNA, herein designated VGAM RNA, also designated SEQ ID:4853.

[74181] A function of VGAM2142 is therefore inhibition of Dihydrolipoamide Branched Chain Transacylase (E2 component of branched chain keto acid dehydrogenase complex; maple syrup urine disease) (DBT, Accession NM_001918). Accordingly, utilities of VGAM2142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBT. Replication Factor C (activator 1) 1, 145kDa (RFC1, Accession NM_002913) is another VGAM2142 host target gene. RFC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by RFC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFC1 BINDING SITE, designated SEQ ID:8817, to the nucleotide sequence of VGAM2142 RNA, herein designated VGAM RNA, also designated SEQ ID:4853.

[74182] Another function of VGAM2142 is therefore inhibition of Replication Factor C (activator 1) 1, 145kDa (RFC1, Accession NM_002913), a gene which plays a role in dna transcription, replication and/or repair. Accordingly, utilities of VGAM2142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFC1. The function of RFC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217.Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM_014011) is another VGAM2142 host target gene. SOCS5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOCS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of SOCS5 BINDING SITE, designated SEQ ID:15232, to the nucleotide sequence of VGAM2142 RNA, herein designated VGAM RNA, also designated SEQ ID:4853.

[74183] Another function of VGAM2142 is therefore inhibition of Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM_014011). Accordingly, utilities of VGAM2142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOCS5. KIAA1376 (Accession XM_033042) is another VGAM2142 host target gene. KIAA1376 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1376 BINDING SITE, designated SEQ ID:31822, to the nucleotide sequence of VGAM2142 RNA, herein designated VGAM RNA, also designated SEQ ID:4853.

[74184] Another function of VGAM2142 is therefore inhibition of KIAA1376 (Accession XM_033042). Accordingly, utilities of VGAM2142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1376. KIAA1617 (Accession XM_166140) is another VGAM2142 host target gene. KIAA1617 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1617 BINDING SITE, designated SEQ ID:43945, to the nucleotide sequence of VGAM2142 RNA, herein designated VGAM RNA, also designated SEQ ID:4853.

[74185] Another function of VGAM2142 is therefore inhibition of KIAA1617 (Accession XM_166140). Accordingly, utilities of VGAM2142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1617. NYD-SP20 (Accession NM_032598) is another VGAM2142 host target gene. NYD-SP20 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NYD-SP20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP20 BINDING SITE, designated SEQ ID:26328, to the nucleotide sequence of VGAM2142 RNA, herein designated

VGAM RNA, also designated SEQ ID:4853.

[74186] Another function of VGAM2142 is therefore inhibition of NYD-SP20 (Accession NM_032598). Accordingly, utilities of VGAM2142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP20. TGFB Inducible Early Growth Response (TIEG, Accession NM_005655) is another VGAM2142 host target gene. TIEG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIEG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIEG BINDING SITE, designated SEQ ID:12193, to the nucleotide sequence of VGAM2142 RNA, herein designated VGAM RNA, also designated SEQ ID:4853.

[74187] Another function of VGAM2142 is therefore inhibition of TGFB Inducible Early Growth Response (TIEG, Accession NM_005655). Accordingly, utilities of VGAM2142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIEG. LOC51339 (Accession NM_016651) is another VGAM2142 host target gene. LOC51339 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

LOC51339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51339 BINDING SITE, designated SEQ ID:18768, to the nucleotide sequence of VGAM2142 RNA, herein designated VGAM RNA, also designated SEQ ID:4853.

[74188] Another function of VGAM2142 is therefore inhibition of LOC51339 (Accession NM_016651). Accordingly, utilities of VGAM2142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51339. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2143 (VGAM2143) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74189] VGAM2143 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2143 was detected is described hereinabove with reference to Figs. 1-8.

[74190] VGAM2143 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Ectromelia Virus. VGAM2143 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74191] VGAM2143 gene encodes a VGAM2143 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2143 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2143 precursor RNA is designated SEQ ID:2129, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2129 is located at position 165143 relative to the genome of Ectromelia Virus.

[74192] VGAM2143 precursor RNA folds onto itself, forming VGAM2143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74193] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2143 folded precursor RNA into VGAM2143 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2143 RNA is designated SEQ ID:4854, and is provided hereinbelow with reference to the sequence listing part.

[74194] VGAM2143 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2143 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2143 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74195] VGAM2143 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2143 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2143 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2143 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2143 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74196] The complementary binding of VGAM2143 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2143 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2143

host target RNA into VGAM2143 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74197] It is appreciated that VGAM2143 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2143 host target genes. The mRNA of each one of this plurality of VGAM2143 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2143 RNA, herein designated VGAM RNA, and which when bound by VGAM2143 RNA causes inhibition of translation of respective one or more VGAM2143 host target proteins.

[74198] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2143 gene, herein designated VGAM GENE, on one or more VGAM2143 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74199] It is yet further appreciated that a function of VGAM2143 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2143 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2143 correlate with, and may be deduced from, the identity of the host target genes which VGAM2143 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74200] Nucleotide sequences of the VGAM2143 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2143 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2143 are further

described hereinbelow with reference to Table 1.

[74201] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2143 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2143 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74202] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2143 gene, herein designated VGAM is inhibition of expression of VGAM2143 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2143 correlate with, and may be deduced from, the identity of the target genes which VGAM2143 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74203] Espin (ESPN, Accession NM_031475) is a VGAM2143 host target gene. ESPN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESPN BINDING SITE, designated SEQ

ID:25548, to the nucleotide sequence of VGAM2143 RNA, herein designated VGAM RNA, also designated SEQ ID:4854.

[74204] A function of VGAM2143 is therefore inhibition of Espin (ESPN, Accession NM_031475), a gene which a membrane-cytoskeletal assemblages . Accordingly, utilities of VGAM2143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESPN. The function of ESPN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1006.Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM_085943) is another VGAM2143 host target gene. GRLF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRLF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, designated SEQ ID:38407, to the nucleotide sequence of VGAM2143 RNA, herein designated VGAM RNA, also designated SEQ ID:4854.

[74205] Another function of VGAM2143 is therefore inhibition of

Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM_085943), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of VGAM2143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRLF1. The function of GRLF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Integrin, Alpha 2 (CD49B, alpha 2 subunit of VLA-2 receptor) (ITGA2, Accession NM_002203) is another VGAM2143 host target gene. ITGA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA2 BINDING SITE, designated SEQ ID:7962, to the nucleotide sequence of VGAM2143 RNA, herein designated VGAM RNA, also designated SEQ ID:4854.

[74206] Another function of VGAM2143 is therefore inhibition of Integrin, Alpha 2 (CD49B, alpha 2 subunit of VLA-2 receptor) (ITGA2, Accession NM_002203), a gene which has roles in blood clotting and angiogenesis, acts as a colla-

gen and laminin receptor. Accordingly, utilities of VGAM2143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA2. The function of ITGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827.Wilms Tumor 1 (WT1, Accession NM_024424) is another VGAM2143 host target gene. WT1 BINDING SITE1 through WT1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WT1 BINDING SITE1 through WT1 BINDING SITE4, designated SEQ ID:23667, SEQ ID:23671, SEQ ID:23675 and SEQ ID:5951 respectively, to the nucleotide sequence of VGAM2143 RNA, herein designated VGAM RNA, also designated SEQ ID:4854.

[74207] Another function of VGAM2143 is therefore inhibition of Wilms Tumor 1 (WT1, Accession NM_024424). Accordingly, utilities of VGAM2143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WT1. KIAA0993 (Accession XM_034413) is an-

other VGAM2143 host target gene. KIAA0993 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0993 BINDING SITE, designated SEQ ID:32083, to the nucleotide sequence of VGAM2143 RNA, herein designated VGAM RNA, also designated SEQ ID:4854.

[74208] Another function of VGAM2143 is therefore inhibition of KIAA0993 (Accession XM_034413). Accordingly, utilities of VGAM2143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0993. KIAA1416 (Accession XM_098762) is another VGAM2143 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41797, to the nucleotide sequence of VGAM2143 RNA, herein designated VGAM RNA, also designated SEQ ID:4854.

[74209] Another function of VGAM2143 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM2143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. My015 (Accession XM_039512) is another VGAM2143 host target gene. My015 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by My015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of My015 BINDING SITE, designated SEQ ID:33103, to the nucleotide sequence of VGAM2143 RNA, herein designated VGAM RNA, also designated SEQ ID:4854.

[74210] Another function of VGAM2143 is therefore inhibition of My015 (Accession XM_039512). Accordingly, utilities of VGAM2143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with My015. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737) is another VGAM2143 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:16388, to the nucleotide sequence of VGAM2143 RNA, herein designated VGAM RNA, also designated SEQ ID:4854.

[74211] Another function of VGAM2143 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737). Accordingly, utilities of VGAM2143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285) is another VGAM2143 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:27101 and SEQ ID:36112 respectively, to the nucleotide sequence of VGAM2143 RNA, herein designated VGAM RNA, also designated SEQ ID:4854.

[74212] Another function of VGAM2143 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285). Accordingly, utilities of VGAM2143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1. LOC157503 (Accession XM_098767) is another VGAM2143 host target gene. LOC157503 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157503 BINDING SITE, designated SEQ ID:41815, to the nucleotide sequence of VGAM2143 RNA, herein designated VGAM RNA, also designated SEQ ID:4854.

[74213] Another function of VGAM2143 is therefore inhibition of LOC157503 (Accession XM_098767). Accordingly, utilities of VGAM2143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157503. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2144 (VGAM2144) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74214] VGAM2144 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2144 was detected is described hereinabove with reference to Figs. 1-8.

[74215] VGAM2144 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2144 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74216] VGAM2144 gene encodes a VGAM2144 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2144 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2144 precursor RNA is designated SEQ ID:2130, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2130 is located at position 168263 relative to the genome of Ectromelia Virus.

[74217] VGAM2144 precursor RNA folds onto itself, forming

VGAM2144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74218] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2144 folded precursor RNA into VGAM2144 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2144 RNA is designated SEQ ID:4855, and is provided hereinbelow with reference to the sequence listing part.

[74219] VGAM2144 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2144 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2144 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74220] VGAM2144 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2144 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2144 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2144 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2144 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74221] The complementary binding of VGAM2144 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2144 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2144 host target RNA into VGAM2144 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74222] It is appreciated that VGAM2144 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2144 host target genes. The mRNA of each one of this plurality of VGAM2144 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2144 RNA, herein designated VGAM RNA, and which when bound by VGAM2144 RNA causes inhibition of translation of respective one or more VGAM2144 host target proteins.

[74223] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2144 gene, herein designated VGAM GENE, on one or more VGAM2144 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74224] It is yet further appreciated that a function of VGAM2144 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2144 correlate with, and may be deduced from, the identity of the host target genes which VGAM2144 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[74225] Nucleotide sequences of the VGAM2144 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2144 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2144 are further described hereinbelow with reference to Table 1.

[74226] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2144 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2144 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74227] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2144 gene, herein designated VGAM is inhibition of expression of VGAM2144 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2144 correlate with, and may be deduced from, the identity of the target genes which VGAM2144 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[74228] ATPase, Class VI, Type 11A (ATP11A, Accession XM_085028) is a VGAM2144 host target gene. ATP11A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11A BINDING SITE, designated SEQ ID:37808, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74229] A function of VGAM2144 is therefore inhibition of ATPase, Class VI, Type 11A (ATP11A, Accession XM_085028). Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11A. Chemokine (C-X-C motif) Receptor 6 (CXCR6, Accession NM_006564) is another VGAM2144 host target gene. CXCR6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CXCR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXCR6 BINDING SITE,

designated SEQ ID:13333, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74230] Another function of VGAM2144 is therefore inhibition of Chemokine (C-X-C motif) Receptor 6 (CXCR6, Accession NM_006564), a gene which probably interacts between dendritic cells and T cells and regulates T-cell migration. Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCR6. The function of CXCR6 has been established by previous studies. By RT-PCR on tumor-infiltrating lymphocyte lines with degenerate primers based on sequences of known chemokine receptors, Liao et al. (1997) isolated a cDNA encoding a GPCR, which they designated STRL33. Using an expression cloning strategy with a T-cell cDNA library, Deng et al. (1997) isolated an identical cDNA that they named BONZO. The predicted 342-amino acid STRL33/BONZO protein shares 25 to 30% amino acid identity with other chemokine receptors and is most similar to other GPCRs in the transmembrane domains. Northern blot analysis detected a 2.1-kb transcript in spleen, thymus, small intestine, and to a lesser extent in peripheral blood leukocytes, prostate, and colon; a

2.6-kb transcript was detected in placenta (Deng et al., 1997). By fluorometric calcium flux analysis, Liao et al. (1997) were unable to detect responses in STRL33-expressing cells to a variety of chemokines. However, coexpression of CD4 and STRL33/BONZO rendered cells able to fuse with macrophage-tropic HIV-1 (transmission-type) strains as well as with simian immunodeficiency virus. Liao et al. (1997) but not Deng et al. (1997) also detected fusion with T-cell-tropic HIV-1 strains. Liao et al. (1997) and Deng et al. (1997) speculated that expression of STRL33/BONZO may substitute for other HIV coreceptors, for example in CCR5 -/- individuals who become infected with HIV. By expression cloning of mouse Cxcl16 (OMIM Ref. No. 605398), Matloubian et al. (2000) identified a protein with 71% amino acid identity to human BONZO, which they renamed CXCR6. Human and mouse cells expressing CXCR6 showed a strong chemotactic response to CXCL16 but not to other chemokines. The authors concluded that CXCL16 and CXCR6 probably function in interactions between dendritic cells and T cells and in regulating T-cell migration in the splenic red pulp.

[74231] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[74232] Liao, F.; Alkhatib, G.; Peden, K. W. C.; Sharma, G.; Berger, E. A.; Farber, J. M. : STRL33, a novel chemokine receptor-like protein, functions as a fusion cofactor for both macrophage-tropic and T cell line-tropic HIV-1. J. Exp. Med. 185: 2015-2023, 1997. ; and

[74233] Matloubian, M.; David, A.; Engel, S.; Ryan, J. E.; Cyster, J. G. : A transmembrane CXC chemokine is a ligand for HIV-coreceptor Bonzo. Nature Immun. 1: 298-304, 2000.

[74234] Further studies establishing the function and utilities of CXCR6 are found in John Hopkins OMIM database record ID 605163, and in sited publications numbered 4392-4394 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.DNA-damage-inducible Transcript 3 (DDIT3, Accession NM_004083) is another VGAM2144 host target gene. DDIT3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DDIT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDIT3 BINDING SITE, designated SEQ

ID:10287, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74235] Another function of VGAM2144 is therefore inhibition of DNA-damage-inducible Transcript 3 (DDIT3, Accession NM_004083), a gene which May be a transcription factor and inhibits the DNA-binding activity of C/EBP and LAP. Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDIT3. The function of DDIT3 has been established by previous studies. CHOP is consistently rearranged in myxoid liposarcomas (Aman et al., 1992). In the characteristic chromosomal translocation t(12;16)(q13;p11), Crozat et al. (1993) showed that the CHOP gene is fused with a gene on chromosome 16 provisionally designated TLS (for 'translocated in liposarcoma'). The same gene was called FUS by Rabbitts et al. (1993); see 137070. The TLS gene was found to be a novel nuclear RNA-binding protein with extensive sequence similarity to EWS (OMIM Ref. No. 133450), the product of a gene commonly translocated in Ewing sarcoma. In TLS-CHOP, the RNA-binding domain of TLS is replaced by the DNA-binding and leucine zipper dimer-

ization domain of CHOP. Targeting of a conserved effector domain of RNA-binding proteins to DNA may play a role in tumor formation. In an analysis of peripheral blood samples from 19 patients with myxoid liposarcoma due to t(12;16) and in 1 patient with myxoid liposarcoma due to t(12;22;20), resulting in the fusion of the CHOP and EWS genes, Panagopoulos et al. (1996) found FUS/CHOP hybrid fragments in 3 patients with t(12;16) and a EWS/CHOP hybrid in the patient with the latter translocation.

[74236] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[74237] Crozat, A.; Aman, P.; Mandahl, N.; Ron, D. : Fusion of CHOP to a novel RNA-binding protein in human myxoid liposarcoma. Nature 363: 640-644, 1993. ; and

[74239] Further studies establishing the function and utilities of DDIT3 are found in John Hopkins OMIM database record ID 126337, and in sited publications numbered 87 and 3095-3100 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference.Fibroblast Growth Factor Receptor-like 1 (FGFRL1, Accession NM_021923) is another VGAM2144 host target gene. FGFRL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FGFRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFRL1 BINDING SITE, designated SEQ ID:22451, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74240] Another function of VGAM2144 is therefore inhibition of Fibroblast Growth Factor Receptor-like 1 (FGFRL1, Accession NM_021923). Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFRL1. Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM_003759) is another VGAM2144 host target gene. SLC4A4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A4 BINDING SITE, designated SEQ ID:9838, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74241] Another function of VGAM2144 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM_003759), a gene which is a sodium bicarbonate cotransporter. Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A4. The function of SLC4A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM222.Tropomodulin (TMOD, Accession NM_003275) is another VGAM2144 host target gene. TMOD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TMOD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMOD BINDING SITE, designated SEQ ID:9294, to the nucleotide sequence of

VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74242] Another function of VGAM2144 is therefore inhibition of Tropomodulin (TMOD, Accession NM_003275), a gene which blocks the elongation and depolymerization of the actin filaments at the pointed end. Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMOD. The function of TMOD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM716.FGD1 Family, Member 3 (FGD3, Accession XM_053487) is another VGAM2144 host target gene. FGD3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FGD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGD3 BINDING SITE, designated SEQ ID:36091, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74243] Another function of VGAM2144 is therefore inhibition of FGD1 Family, Member 3 (FGD3, Accession XM_053487).

Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGD3. FLJ12838 (Accession NM_024641) is another VGAM2144 host target gene. FLJ12838 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12838 BINDING SITE, designated SEQ ID:23924, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74244] Another function of VGAM2144 is therefore inhibition of FLJ12838 (Accession NM_024641). Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12838. HIC (Accession XM_041273) is another VGAM2144 host target gene. HIC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of HIC BINDING SITE, designated SEQ ID:33494, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74245] Another function of VGAM2144 is therefore inhibition of HIC (Accession XM_041273). Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC. KIAA1309 (Accession NM_033495) is another VGAM2144 host target gene. KIAA1309 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1309 BINDING SITE, designated SEQ ID:27264, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74246] Another function of VGAM2144 is therefore inhibition of KIAA1309 (Accession NM_033495). Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1309. Sodium Channel, Voltage-gated, Type XII, Al-

pha Polypeptide (SCN12A, Accession NM_014139) is another VGAM2144 host target gene. SCN12A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCN12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN12A BINDING SITE, designated SEQ ID:15410, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74247] Another function of VGAM2144 is therefore inhibition of Sodium Channel, Voltage-gated, Type XII, Alpha Polypeptide (SCN12A, Accession NM_014139). Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN12A. LOC145333 (Accession XM_096766) is another VGAM2144 host target gene. LOC145333 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145333 BINDING SITE, designated SEQ ID:40533, to

the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74248] Another function of VGAM2144 is therefore inhibition of LOC145333 (Accession XM_096766). Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145333. LOC162333 (Accession XM_102591) is another VGAM2144 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42137, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74249] Another function of VGAM2144 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC222662 (Accession XM_167086) is another VGAM2144 host target gene. LOC222662 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC222662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222662 BINDING SITE, designated SEQ ID:44600, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74250] Another function of VGAM2144 is therefore inhibition of LOC222662 (Accession XM_167086). Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222662. LOC255082 (Accession XM_172843) is another VGAM2144 host target gene. LOC255082 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255082 BINDING SITE, designated SEQ ID:46115, to the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, also designated SEQ ID:4855.

[74251] Another function of VGAM2144 is therefore inhibition of LOC255082 (Accession XM_172843). Accordingly, utilities

of VGAM2144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255082. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2145 (VGAM2145) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74252] VGAM2145 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2145 was detected is described hereinabove with reference to Figs. 1-8.

[74253] VGAM2145 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2145 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74254] VGAM2145 gene encodes a VGAM2145 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2145 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2145 precursor RNA is designated SEQ ID:2131, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2131 is located at position 182220 relative to the genome of Ectromelia Virus.

[74255] VGAM2145 precursor RNA folds onto itself, forming VGAM2145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74256] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2145 folded precursor RNA into VGAM2145 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2145 RNA is designated SEQ ID:4856, and

is provided hereinbelow with reference to the sequence listing part.

[74257] VGAM2145 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2145 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2145 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74258] VGAM2145 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2145 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2145 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2145 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2145 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74259] The complementary binding of VGAM2145 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2145 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2145 host target RNA into VGAM2145 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74260] It is appreciated that VGAM2145 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2145 host target genes. The mRNA of each one of this plurality of VGAM2145 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2145 RNA, herein designated VGAM RNA, and which when bound by VGAM2145 RNA causes inhibition of translation of respective one or more VGAM2145 host target proteins.

[74261] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2145 gene, herein designated VGAM GENE, on one or more VGAM2145 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74262] It is yet further appreciated that a function of VGAM2145 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2145 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2145 correlate with, and may be deduced from, the identity of the host target genes which VGAM2145 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74263] Nucleotide sequences of the VGAM2145 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2145 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2145 are further described hereinbelow with reference to Table 1.

[74264] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2145 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2145 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74265] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2145 gene, herein designated VGAM is inhibition of expression of VGAM2145 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2145 correlate with, and may be deduced from, the identity of the target genes which VGAM2145 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74266] Early Growth Response 2 (Krox-20 homolog, Drosophila) (EGR2, Accession NM_000399) is a VGAM2145 host target gene. EGR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EGR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR2 BINDING SITE, designated SEQ ID:5971, to the nucleotide sequence of VGAM2145 RNA, herein designated VGAM RNA, also designated SEQ ID:4856.

[74267] A function of VGAM2145 is therefore inhibition of Early Growth Response 2 (Krox-20 homolog, Drosophila) (EGR2, Accession NM_000399), a gene which binds to two specific dna sites located in the promoter region of hox-1.4. Accordingly, utilities of VGAM2145 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with EGR2. The function of EGR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM234.LOC147184 (Accession NM_145274) is another VGAM2145 host target gene. LOC147184 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147184 BINDING SITE, designated SEQ ID:29787, to the nucleotide sequence of VGAM2145 RNA, herein designated VGAM RNA, also designated SEQ ID:4856.

[74268] Another function of VGAM2145 is therefore inhibition of LOC147184 (Accession NM_145274). Accordingly, utilities of VGAM2145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147184. LOC90499 (Accession XM_032170) is another VGAM2145 host target gene. LOC90499 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90499, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90499 BINDING SITE, designated SEQ ID:31583, to the nucleotide sequence of VGAM2145 RNA, herein designated VGAM RNA, also designated SEQ ID:4856.

[74269] Another function of VGAM2145 is therefore inhibition of LOC90499 (Accession XM_032170). Accordingly, utilities of VGAM2145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90499. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2146 (VGAM2146) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74270] VGAM2146 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2146 was detected is described hereinabove with reference to Figs. 1-8.

[74271] VGAM2146 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2146 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[74272] VGAM2146 gene encodes a VGAM2146 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2146 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2146 precursor RNA is designated SEQ ID:2132, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2132 is located at position 55138 relative to the genome of Rana Tigrina Ranavirus.

[74273] VGAM2146 precursor RNA folds onto itself, forming VGAM2146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74274] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2146 folded precursor RNA into VGAM2146

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2146 RNA is designated SEQ ID:4857, and is provided hereinbelow with reference to the sequence listing part.

[74275] VGAM2146 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2146 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2146 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74276] VGAM2146 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2146 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2146 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2146 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2146 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74277] The complementary binding of VGAM2146 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2146 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2146 host target RNA into VGAM2146 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[74278] It is appreciated that VGAM2146 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2146 host target genes. The mRNA of each one of this plurality of VGAM2146 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2146 RNA, herein designated VGAM RNA, and which when bound by VGAM2146 RNA causes inhibition of translation of respective one or more VGAM2146 host target proteins.

[74279] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2146 gene, herein designated VGAM GENE, on one or more VGAM2146 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74280] It is yet further appreciated that a function of VGAM2146 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2146 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2146 correlate with, and may be deduced from, the identity of the host target genes which VGAM2146 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74281] Nucleotide sequences of the VGAM2146 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2146 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2146 are further described hereinbelow with reference to Table 1.

[74282] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2146 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2146 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74283] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2146 gene, herein designated VGAM is inhibition of expression of VGAM2146 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2146 correlate with, and may be deduced from, the identity of the target genes which VGAM2146 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74284] Lipin 2 (LPIN2, Accession NM_014646) is a VGAM2146 host target gene. LPIN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LPIN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPIN2 BINDING SITE, designated SEQ ID:16059, to the nucleotide sequence of VGAM2146 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4857.

[74285] A function of VGAM2146 is therefore inhibition of Lipin 2 (LPIN2, Accession NM_014646). Accordingly, utilities of VGAM2146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPIN2. Aminocarboxymuconate Semialdehyde Decarboxylase (acmsd, Accession NM_138326) is another VGAM2146 host target gene. acmsd BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by acmsd, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of acmsd BINDING SITE, designated SEQ ID:28728, to the nucleotide sequence of VGAM2146 RNA, herein designated VGAM RNA, also designated SEQ ID:4857.

[74286] Another function of VGAM2146 is therefore inhibition of Aminocarboxymuconate Semialdehyde Decarboxylase (acmsd, Accession NM_138326). Accordingly, utilities of VGAM2146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with acmsd. Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM_027172) is another VGAM2146 host target gene.

C1orf34 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:30431, to the nucleotide sequence of VGAM2146 RNA, herein designated VGAM RNA, also designated SEQ ID:4857.

[74287] Another function of VGAM2146 is therefore inhibition of Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM_027172). Accordingly, utilities of VGAM2146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34. KIAA1110 (Accession XM_029973) is another VGAM2146 host target gene. KIAA1110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1110 BINDING SITE, designated SEQ ID:30980, to the nucleotide sequence of VGAM2146 RNA, herein designated VGAM RNA, also designated SEQ

ID:4857.

[74288] Another function of VGAM2146 is therefore inhibition of KIAA1110 (Accession XM_029973). Accordingly, utilities of VGAM2146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1110. MGC14258 (Accession NM_032900) is another VGAM2146 host target gene. MGC14258 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC14258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14258 BINDING SITE, designated SEQ ID:26724, to the nucleotide sequence of VGAM2146 RNA, herein designated VGAM RNA, also designated SEQ ID:4857.

[74289] Another function of VGAM2146 is therefore inhibition of MGC14258 (Accession NM_032900). Accordingly, utilities of VGAM2146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14258. LOC150372 (Accession XM_086893) is another VGAM2146 host target gene. LOC150372 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150372, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150372 BINDING SITE, designated SEQ ID:38942, to the nucleotide sequence of VGAM2146 RNA, herein designated VGAM RNA, also designated SEQ ID:4857.

[74290] Another function of VGAM2146 is therefore inhibition of LOC150372 (Accession XM_086893). Accordingly, utilities of VGAM2146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150372. LOC153516 (Accession NM_138491) is another VGAM2146 host target gene. LOC153516 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153516 BINDING SITE, designated SEQ ID:28840, to the nucleotide sequence of VGAM2146 RNA, herein designated VGAM RNA, also designated SEQ ID:4857.

[74291] Another function of VGAM2146 is therefore inhibition of LOC153516 (Accession NM_138491). Accordingly, utilities of VGAM2146 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC153516. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2147 (VGAM2147) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74292] VGAM2147 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2147 was detected is described hereinabove with reference to Figs. 1-8.

[74293] VGAM2147 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2147 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74294] VGAM2147 gene encodes a VGAM2147 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2147 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2147 precursor RNA is desig-

nated SEQ ID:2133, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2133 is located at position 47097 relative to the genome of Rana Tigrina Ranavirus.

[74295] VGAM2147 precursor RNA folds onto itself, forming VGAM2147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74296] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2147 folded precursor RNA into VGAM2147 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2147 RNA is designated SEQ ID:4858, and is provided hereinbelow with reference to the sequence

listing part.

[74297] VGAM2147 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2147 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2147 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74298] VGAM2147 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2147 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2147 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2147 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2147 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74299] The complementary binding of VGAM2147 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2147 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2147 host target RNA into VGAM2147 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74300] It is appreciated that VGAM2147 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2147 host target genes. The mRNA of each one of this plurality of VGAM2147 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2147 RNA, herein designated VGAM

RNA, and which when bound by VGAM2147 RNA causes inhibition of translation of respective one or more VGAM2147 host target proteins.

[74301] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2147 gene, herein designated VGAM GENE, on one or more VGAM2147 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74302] It is yet further appreciated that a function of VGAM2147 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2147 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2147 correlate with, and may be deduced from, the identity of the host target genes which VGAM2147 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74303] Nucleotide sequences of the VGAM2147 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2147 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2147 are further described hereinbelow with reference to Table 1.

[74304] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2147 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2147 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74305] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2147 gene, herein designated VGAM is

inhibition of expression of VGAM2147 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2147 correlate with, and may be deduced from, the identity of the target genes which VGAM2147 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74306] GAC1 (Accession NM_006338) is a VGAM2147 host target gene. GAC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAC1 BINDING SITE, designated SEQ ID:13038, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74307] A function of VGAM2147 is therefore inhibition of GAC1 (Accession NM_006338). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAC1. LAPTM5 (Accession NM_006762) is another VGAM2147 host target gene. LAPTM5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LAPTM5, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAPTM5 BINDING SITE, designated SEQ ID:13617, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74308] Another function of VGAM2147 is therefore inhibition of LAPTM5 (Accession NM_006762). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAPTM5. Sodium Channel, Voltage-gated, Type IV, Alpha Polypeptide (SCN4A, Accession NM_000334) is another VGAM2147 host target gene. SCN4A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCN4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN4A BINDING SITE, designated SEQ ID:5889, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74309] Another function of VGAM2147 is therefore inhibition of Sodium Channel, Voltage-gated, Type IV, Alpha Polypep-

tide (SCN4A, Accession NM_000334). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN4A. Solute Carrier Family 22 (extraneuronal monoamine transporter), Member 3 (SLC22A3, Accession NM_021977) is another VGAM2147 host target gene. SLC22A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC22A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A3 BINDING SITE, designated SEQ ID:22506, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74310] Another function of VGAM2147 is therefore inhibition of Solute Carrier Family 22 (extraneuronal monoamine transporter), Member 3 (SLC22A3, Accession NM_021977), a gene which is a sodium-ion dependent, high affinity carnitine transporter. also transports organic cations without the involvement of sodium. involved in the active cellular uptake of carnitine. Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with SLC22A3. The function of SLC22A3 has been established by previous studies. By PCR using degenerate oligonucleotides corresponding to common sequence motifs of amphiphilic solute facilitators (e.g., SLC22A1; 602607) on cDNA from a human kidney carcinoma cell line, Grundemann et al. (1998) isolated a cDNA encoding SLC22A3, which they termed 'extraneuronal transporter for monoamine transmitters,' or EMT. The SLC22A3 gene encodes a deduced 556-amino acid protein containing 12 transmembrane segments. Expression analysis showed uptake of known catecholamine substrates by SLC22A3. RT-PCR analysis detected SLC22A3 expression in brain cortex, heart, and liver. Wu et al. (1998) showed that recombinant rat Oct3 can transport a wide variety of cationic neurotoxins and neurotransmitters, including 1-methyl-4-phenylpyridinium ion (MPP+) and dopamine. Oct3 was inhibited by several steroids, with beta-estradiol the most potent inhibitor. The authors stated that the transport characteristics and steroid sensitivity of Oct3 provide strong evidence for its molecular identity as the extraneuronal monoamine transporter (uptake-2). Northern blot analysis detected Oct3 expression in a number of

rat tissues, including brain. In situ hybridization of rat brain showed that Oct3 is widely expressed in the brain, including in the hippocampus, cerebellum, and cerebral cortex. Wu et al. (1998) suggested that OCT3 plays a significant role in the disposition of cationic neurotoxins and neurotransmitters in the brain.

[74311] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[74312] Grundemann, D.; Schechinger, B.; Rappold, G. A.; Schomig, E. : Molecular identification of the corticosterone-sensitive extraneuronal catecholamine transporter. Nature Neurosci. 1: 349-351, 1998. ; and

[74313] Wu, X.; Kekuda, R.; Huang, W.; Fei, Y.-J.; Leibach, F. H.; Chen, J.; Conway, S. J.; Ganapathy, V. : Identity of the organic cation transporter OCT3 as the extraneuronal monoamine transport.

[74314] Further studies establishing the function and utilities of SLC22A3 are found in John Hopkins OMIM database record ID 604842, and in sited publications numbered 694 and 5233 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.T-cell Leukemia Translocation Altered Gene (TCTA,

Accession NM_022171) is another VGAM2147 host target gene. TCTA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TCTA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCTA BINDING SITE, designated SEQ ID:22731, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74315] Another function of VGAM2147 is therefore inhibition of T-cell Leukemia Translocation Altered Gene (TCTA, Accession NM_022171). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCTA. Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_007331) is another VGAM2147 host target gene. WHSC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WHSC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:14251, to the nucleotide sequence of VGAM2147 RNA,

herein designated VGAM RNA, also designated SEQ ID:4858.

[74316] Another function of VGAM2147 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_007331), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.WWP2 (Accession XM_028151) is another VGAM2147 host target gene. WWP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WWP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WWP2 BINDING SITE, designated SEQ ID:30622, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74317] Another function of VGAM2147 is therefore inhibition of WWP2 (Accession XM_028151), a gene which exhibits

ubiquitin-protein ligase activity and contains WW and HECT domains. Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WWP2. The function of WWP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072) is another VGAM2147 host target gene. C1QR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1QR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QR1 BINDING SITE, designated SEQ ID:14332, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74318] Another function of VGAM2147 is therefore inhibition of Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QR1.

CPR2 (Accession NM_030900) is another VGAM2147 host target gene. CPR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPR2 BINDING SITE, designated SEQ ID:25174, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74319] Another function of VGAM2147 is therefore inhibition of CPR2 (Accession NM_030900). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPR2. FLJ21195 (Accession NM_022469) is another VGAM2147 host target gene. FLJ21195 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21195 BINDING SITE, designated SEQ ID:22827, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4858.

[74320] Another function of VGAM2147 is therefore inhibition of FLJ21195 (Accession NM_022469). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21195. FLJ22795 (Accession NM_025084) is another VGAM2147 host target gene. FLJ22795 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22795 BINDING SITE, designated SEQ ID:24690, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74321] Another function of VGAM2147 is therefore inhibition of FLJ22795 (Accession NM_025084). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22795. Glutamate Receptor Interacting Protein 1 (GRIP1, Accession XM_047362) is another VGAM2147 host target gene. GRIP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by GRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIP1 BINDING SITE, designated SEQ ID:34962, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74322] Another function of VGAM2147 is therefore inhibition of Glutamate Receptor Interacting Protein 1 (GRIP1, Accession XM_047362). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIP1. KIAA0014 (Accession NM_014665) is another VGAM2147 host target gene. KIAA0014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0014 BINDING SITE, designated SEQ ID:16116, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74323] Another function of VGAM2147 is therefore inhibition of

KIAA0014 (Accession NM_014665). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0014. KIAA1157 (Accession XM_051093) is another VGAM2147 host target gene. KIAA1157 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1157 BINDING SITE, designated SEQ ID:35752, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74324] Another function of VGAM2147 is therefore inhibition of KIAA1157 (Accession XM_051093). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1157. KIAA1274 (Accession XM_166125) is another VGAM2147 host target gene. KIAA1274 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1274 BINDING SITE, designated SEQ ID:43912, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74325] Another function of VGAM2147 is therefore inhibition of KIAA1274 (Accession XM_166125). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1274. KIAA1393 (Accession XM_050793) is another VGAM2147 host target gene. KIAA1393 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1393 BINDING SITE, designated SEQ ID:35687, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74326] Another function of VGAM2147 is therefore inhibition of KIAA1393 (Accession XM_050793). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1393. KIAA1909 (Accession XM_057996) is another

VGAM2147 host target gene. KIAA1909 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1909 BINDING SITE, designated SEQ ID:36558, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74327] Another function of VGAM2147 is therefore inhibition of KIAA1909 (Accession XM_057996). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1909. Kallikrein 6 (neurosin, zyme) (KLK6, Accession NM_002774) is another VGAM2147 host target gene. KLK6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KLK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLK6 BINDING SITE, designated SEQ ID:8665, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74328] Another function of VGAM2147 is therefore inhibition of Kallikrein 6 (neurosin, zyme) (KLK6, Accession NM_002774). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK6. l(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM_114201) is another VGAM2147 host target gene. L3MBTL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by L3MBTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of L3MBTL2 BINDING SITE, designated SEQ ID:42792, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74329] Another function of VGAM2147 is therefore inhibition of l(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM_114201). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with L3MBTL2. LIM Domain Kinase 2 (LIMK2, Accession NM_016733) is another VGAM2147 host target gene. LIMK2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by LIMK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK2 BINDING SITE, designated SEQ ID:18786, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74330] Another function of VGAM2147 is therefore inhibition of LIM Domain Kinase 2 (LIMK2, Accession NM_016733). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK2. MGC15476 (Accession NM_145056) is another VGAM2147 host target gene. MGC15476 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC15476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15476 BINDING SITE, designated SEQ ID:29689, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74331] Another function of VGAM2147 is therefore inhibition of

MGC15476 (Accession NM_145056). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15476. Matrix Metalloproteinase 24 (membrane-inserted) (MMP24, Accession NM_006690) is another VGAM2147 host target gene. MMP24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MMP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP24 BINDING SITE, designated SEQ ID:13505, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74332] Another function of VGAM2147 is therefore inhibition of Matrix Metalloproteinase 24 (membrane-inserted) (MMP24, Accession NM_006690). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP24. Oxysterol Binding Protein-like 5 (OSBPL5, Accession XM_052567) is another VGAM2147 host target gene. OSBPL5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OS-

BPL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL5 BINDING SITE, designated SEQ ID:35989, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74333] Another function of VGAM2147 is therefore inhibition of Oxysterol Binding Protein-like 5 (OSBPL5, Accession XM_052567). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL5. SH3 and Multiple Ankyrin Repeat Domains 3 (SHANK3, Accession XM_037493) is another VGAM2147 host target gene. SHANK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SHANK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHANK3 BINDING SITE, designated SEQ ID:32633, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74334] Another function of VGAM2147 is therefore inhibition of SH3 and Multiple Ankyrin Repeat Domains 3 (SHANK3, Accession XM_037493). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHANK3. Ubiquitin Specific Protease 20 (USP20, Accession NM_006676) is another VGAM2147 host target gene. USP20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP20 BINDING SITE, designated SEQ ID:13503, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74335] Another function of VGAM2147 is therefore inhibition of Ubiquitin Specific Protease 20 (USP20, Accession NM_006676). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP20. LOC145717 (Accession XM_039771) is another VGAM2147 host target gene. LOC145717 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by LOC145717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145717 BINDING SITE, designated SEQ ID:33194, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74336] Another function of VGAM2147 is therefore inhibition of LOC145717 (Accession XM_039771). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145717. LOC157503 (Accession XM_098767) is another VGAM2147 host target gene. LOC157503 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157503 BINDING SITE, designated SEQ ID:41814, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74337] Another function of VGAM2147 is therefore inhibition of LOC157503 (Accession XM_098767). Accordingly, utilities

of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157503. LOC159199 (Accession XM_089441) is another VGAM2147 host target gene. LOC159199 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159199 BINDING SITE, designated SEQ ID:39981, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74338] Another function of VGAM2147 is therefore inhibition of LOC159199 (Accession XM_089441). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159199. LOC205143 (Accession XM_119394) is another VGAM2147 host target gene. LOC205143 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC205143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC205143 BINDING SITE, designated SEQ ID:43585, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74339] Another function of VGAM2147 is therefore inhibition of LOC205143 (Accession XM_119394). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205143. LOC220537 (Accession XM_165406) is another VGAM2147 host target gene. LOC220537 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220537 BINDING SITE, designated SEQ ID:43623, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74340] Another function of VGAM2147 is therefore inhibition of LOC220537 (Accession XM_165406). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220537. LOC256230 (Accession XM_173371) is another VGAM2147 host target gene. LOC256230 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256230, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256230 BINDING SITE, designated SEQ ID:46541, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74341] Another function of VGAM2147 is therefore inhibition of LOC256230 (Accession XM_173371). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256230. LOC256231 (Accession XM_173372) is another VGAM2147 host target gene. LOC256231 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256231 BINDING SITE, designated SEQ ID:46543, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74342] Another function of VGAM2147 is therefore inhibition of

LOC256231 (Accession XM_173372). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256231. LOC256789 (Accession XM_173369) is another VGAM2147 host target gene. LOC256789 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256789 BINDING SITE, designated SEQ ID:46537, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74343] Another function of VGAM2147 is therefore inhibition of LOC256789 (Accession XM_173369). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256789. LOC93538 (Accession XM_051927) is another VGAM2147 host target gene. LOC93538 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC93538 BINDING SITE, designated SEQ ID:35924, to the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, also designated SEQ ID:4858.

[74344] Another function of VGAM2147 is therefore inhibition of LOC93538 (Accession XM_051927). Accordingly, utilities of VGAM2147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93538. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2148 (VGAM2148) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74345] VGAM2148 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2148 was detected is described hereinabove with reference to Figs. 1-8.

[74346] VGAM2148 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2148 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[74347] VGAM2148 gene encodes a VGAM2148 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2148 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2148 precursor RNA is designated SEQ ID:2134, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2134 is located at position 62911 relative to the genome of Rana Tigrina Ranavirus.

[74348] VGAM2148 precursor RNA folds onto itself, forming VGAM2148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74349] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2148 folded precursor RNA into VGAM2148 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM2148 RNA is designated SEQ ID:4859, and is provided hereinbelow with reference to the sequence listing part.

[74350] VGAM2148 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2148 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2148 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74351] VGAM2148 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2148 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2148 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2148 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2148 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74352] The complementary binding of VGAM2148 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2148 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2148 host target RNA into VGAM2148 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74353] It is appreciated that VGAM2148 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2148 host target genes. The mRNA of each one of this plurality of VGAM2148 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2148 RNA, herein designated VGAM RNA, and which when bound by VGAM2148 RNA causes inhibition of translation of respective one or more VGAM2148 host target proteins.

[74354] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2148 gene, herein designated VGAM GENE, on one or more VGAM2148 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74355] It is yet further appreciated that a function of VGAM2148 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2148 correlate with, and may be deduced from, the identity of the host target genes which VGAM2148 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74356] Nucleotide sequences of the VGAM2148 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2148 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2148 are further described hereinbelow with reference to Table 1.

[74357] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2148 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2148 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74358] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2148 gene, herein designated VGAM is inhibition of expression of VGAM2148 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2148 correlate with, and may be deduced from, the identity of the target genes which VGAM2148 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74359] Low Density Lipoprotein Receptor (familial hypercholesterolemia) (LDLR, Accession NM_000527) is a VGAM2148 host target gene. LDLR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LDLR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDLR BINDING SITE, designated SEQ ID:6126, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ

ID:4859.

[74360] A function of VGAM2148 is therefore inhibition of Low Density Lipoprotein Receptor (familial hypercholesterolemia) (LDLR, Accession NM_000527), a gene which also acts as a tumor suppressor. Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDLR. The function of LDLR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1030.Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430) is another VGAM2148 host target gene. PAFAH1B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAFAH1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAFAH1B1 BINDING SITE, designated SEQ ID:6007, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74361] Another function of VGAM2148 is therefore inhibition of

Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430). Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAFAH1B1. RAD50 Homolog (S. cerevisiae) (RAD50, Accession NM_005732) is another VGAM2148 host target gene. RAD50 BINDING SITE1 and RAD50 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD50, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD50 BINDING SITE1 and RAD50 BINDING SITE2, designated SEQ ID:12296 and SEQ ID:28554 respectively, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74362] Another function of VGAM2148 is therefore inhibition of RAD50 Homolog (S. cerevisiae) (RAD50, Accession NM_005732), a gene which is involved in dna double-strand break repair (dsbr). Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD50.

The function of RAD50 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132.FLJ10618 (Accession NM_018155) is another VGAM2148 host target gene. FLJ10618 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10618 BINDING SITE, designated SEQ ID:19965, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74363] Another function of VGAM2148 is therefore inhibition of FLJ10618 (Accession NM_018155). Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10618. KIAA0560 (Accession XM_029045) is another VGAM2148 host target gene. KIAA0560 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0560 BINDING SITE, designated SEQ ID:30836, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74364] Another function of VGAM2148 is therefore inhibition of KIAA0560 (Accession XM_029045). Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0560. KIAA0748 (Accession NM_014796) is another VGAM2148 host target gene. KIAA0748 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0748 BINDING SITE, designated SEQ ID:16700, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74365] Another function of VGAM2148 is therefore inhibition of KIAA0748 (Accession NM_014796). Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0748. KIAA0930 (Accession XM_047214) is another

VGAM2148 host target gene. KIAA0930 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0930 BINDING SITE, designated SEQ ID:34910, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74366] Another function of VGAM2148 is therefore inhibition of KIAA0930 (Accession XM_047214). Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0930. KIAA1238 (Accession XM_048675) is another VGAM2148 host target gene. KIAA1238 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1238 BINDING SITE, designated SEQ ID:35214, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74367] Another function of VGAM2148 is therefore inhibition of KIAA1238 (Accession XM_048675). Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1238. SEF (Accession XM_045300) is another VGAM2148 host target gene. SEF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEF BINDING SITE, designated SEQ ID:34425, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74368] Another function of VGAM2148 is therefore inhibition of SEF (Accession XM_045300). Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEF. Ubiquitin-like, Containing PHD and RING Finger Domains, 2 (UHRF2, Accession XM_055929) is another VGAM2148 host target gene. UHRF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UHRF2, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UHRF2 BINDING SITE, designated SEQ ID:36355, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74369] Another function of VGAM2148 is therefore inhibition of Ubiquitin-like, Containing PHD and RING Finger Domains, 2 (UHRF2, Accession XM_055929). Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UHRF2. LOC133258 (Accession XM_068260) is another VGAM2148 host target gene. LOC133258 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC133258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133258 BINDING SITE, designated SEQ ID:37377, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74370] Another function of VGAM2148 is therefore inhibition of LOC133258 (Accession XM_068260). Accordingly, utilities

of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133258. LOC146229 (Accession XM_085387) is another VGAM2148 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:38106, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74371] Another function of VGAM2148 is therefore inhibition of LOC146229 (Accession XM_085387). Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. LOC148824 (Accession XM_097527) is another VGAM2148 host target gene. LOC148824 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC148824 BINDING SITE, designated SEQ ID:40907, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74372] Another function of VGAM2148 is therefore inhibition of LOC148824 (Accession XM_097527). Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148824. LOC221042 (Accession XM_167669) is another VGAM2148 host target gene. LOC221042 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221042 BINDING SITE, designated SEQ ID:44749, to the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, also designated SEQ ID:4859.

[74373] Another function of VGAM2148 is therefore inhibition of LOC221042 (Accession XM_167669). Accordingly, utilities of VGAM2148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221042. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2149 (VGAM2149) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74374] VGAM2149 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2149 was detected is described hereinabove with reference to Figs. 1-8.

[74375] VGAM2149 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2149 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74376] VGAM2149 gene encodes a VGAM2149 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2149 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2149 precursor RNA is designated SEQ ID:2135, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2135 is located at position 50593 relative to the

genome of Rana Tigrina Ranavirus.

[74377] VGAM2149 precursor RNA folds onto itself, forming VGAM2149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74378] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2149 folded precursor RNA into VGAM2149 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2149 RNA is designated SEQ ID:4860, and is provided hereinbelow with reference to the sequence listing part.

[74379] VGAM2149 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2149 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2149 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74380] VGAM2149 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2149 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2149 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2149 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2149 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74381] The complementary binding of VGAM2149 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2149 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2149 host target RNA into VGAM2149 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74382] It is appreciated that VGAM2149 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2149 host target genes. The mRNA of each one of this plurality of VGAM2149 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2149 RNA, herein designated VGAM RNA, and which when bound by VGAM2149 RNA causes inhibition of translation of respective one or more VGAM2149 host target proteins.

[74383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2149 gene, herein designated VGAM GENE, on one or more VGAM2149 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74384] It is yet further appreciated that a function of VGAM2149 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2149 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2149

correlate with, and may be deduced from, the identity of the host target genes which VGAM2149 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74385] Nucleotide sequences of the VGAM2149 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2149 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2149 are further described hereinbelow with reference to Table 1.

[74386] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2149 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2149 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74387] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2149 gene, herein designated VGAM is inhibition of expression of VGAM2149 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2149 correlate with, and may be deduced

from, the identity of the target genes which VGAM2149 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74388] ATP-binding Cassette, Sub-family A (ABC1), Member 1 (ABCA1, Accession NM_005502) is a VGAM2149 host target gene. ABCA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA1 BINDING SITE, designated SEQ ID:12014, to the nucleotide sequence of VGAM2149 RNA, herein designated VGAM RNA, also designated SEQ ID:4860.

[74389] A function of VGAM2149 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 1 (ABCA1, Accession NM_005502), a gene which camp-dependent and sulfonylurea-sensitive anion transporter. Accordingly, utilities of VGAM2149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA1. The function of ABCA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM1956.General Transcription Factor II, I (GTF2I, Accession NM_032999) is another VGAM2149 host target gene. GTF2I BINDING SITE1 and GTF2I BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GTF2I, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2I BINDING SITE1 and GTF2I BINDING SITE2, designated SEQ ID:26884 and SEQ ID:26888 respectively, to the nucleotide sequence of VGAM2149 RNA, herein designated VGAM RNA, also designated SEQ ID:4860.

[74390] Another function of VGAM2149 is therefore inhibition of General Transcription Factor II, I (GTF2I, Accession NM_032999), a gene which interacts with the basal transcription machinery by coordinating the formation of a multiprotein complex at the c-fos promoter, and linking specific signal responsive activator complexes. Accordingly, utilities of VGAM2149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2I. The function of GTF2I and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM115.FLJ21736 (Accession NM_024922) is another VGAM2149 host target gene. FLJ21736 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ21736, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21736 BINDING SITE, designated SEQ ID:24457, to the nucleotide sequence of VGAM2149 RNA, herein designated VGAM RNA, also designated SEQ ID:4860.

[74391] Another function of VGAM2149 is therefore inhibition of FLJ21736 (Accession NM_024922). Accordingly, utilities of VGAM2149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21736. KIAA1582 (Accession XM_037262) is another VGAM2149 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32588, to the

nucleotide sequence of VGAM2149 RNA, herein designated VGAM RNA, also designated SEQ ID:4860.

[74392] Another function of VGAM2149 is therefore inhibition of KIAA1582 (Accession XM_037262). Accordingly, utilities of VGAM2149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. KIAA1775 (Accession NM_033100) is another VGAM2149 host target gene. KIAA1775 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1775 BINDING SITE, designated SEQ ID:26940, to the nucleotide sequence of VGAM2149 RNA, herein designated VGAM RNA, also designated SEQ ID:4860.

[74393] Another function of VGAM2149 is therefore inhibition of KIAA1775 (Accession NM_033100). Accordingly, utilities of VGAM2149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1775. Lysosomal-associated Membrane Protein 3 (LAMP3, Accession XM_003022) is another VGAM2149 host target gene. LAMP3 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by LAMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMP3 BINDING SITE, designated SEQ ID:29918, to the nucleotide sequence of VGAM2149 RNA, herein designated VGAM RNA, also designated SEQ ID:4860.

[74394] Another function of VGAM2149 is therefore inhibition of Lysosomal-associated Membrane Protein 3 (LAMP3, Accession XM_003022). Accordingly, utilities of VGAM2149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMP3. LW-1 (Accession XM_013128) is another VGAM2149 host target gene. LW-1 BINDING SITE1 and LW-1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LW-1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LW-1 BINDING SITE1 and LW-1 BINDING SITE2, designated SEQ ID:30232 and SEQ ID:18241 respectively, to the nucleotide sequence of VGAM2149 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4860.

[74395] Another function of VGAM2149 is therefore inhibition of LW-1 (Accession XM_013128). Accordingly, utilities of VGAM2149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LW-1. LOC145781 (Accession XM_085235) is another VGAM2149 host target gene. LOC145781 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145781 BINDING SITE, designated SEQ ID:37981, to the nucleotide sequence of VGAM2149 RNA, herein designated VGAM RNA, also designated SEQ ID:4860.

[74396] Another function of VGAM2149 is therefore inhibition of LOC145781 (Accession XM_085235). Accordingly, utilities of VGAM2149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145781. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2150 (VGAM2150) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74397] VGAM2150 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2150 was detected is described hereinabove with reference to Figs. 1-8.

[74398] VGAM2150 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2150 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74399] VGAM2150 gene encodes a VGAM2150 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2150 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2150 precursor RNA is designated SEQ ID:2136, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2136 is located at position 52091 relative to the genome of Rana Tigrina Ranavirus.

[74400] VGAM2150 precursor RNA folds onto itself, forming

VGAM2150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74401] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2150 folded precursor RNA into VGAM2150 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2150 RNA is designated SEQ ID:4861, and is provided hereinbelow with reference to the sequence listing part.

[74402] VGAM2150 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2150 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2150 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74403] VGAM2150 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2150 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2150 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2150 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2150 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74404] The complementary binding of VGAM2150 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2150 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2150 host target RNA into VGAM2150 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74405] It is appreciated that VGAM2150 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2150 host target genes. The mRNA of each one of this plurality of VGAM2150 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2150 RNA, herein designated VGAM RNA, and which when bound by VGAM2150 RNA causes inhibition of translation of respective one or more VGAM2150 host target proteins.

[74406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2150 gene, herein designated VGAM GENE, on one or more VGAM2150 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74407] It is yet further appreciated that a function of VGAM2150 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2150 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2150 correlate with, and may be deduced from, the identity of the host target genes which VGAM2150 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74408] Nucleotide sequences of the VGAM2150 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2150 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2150 are further described hereinbelow with reference to Table 1.

[74409] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2150 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2150 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74410] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2150 gene, herein designated VGAM is inhibition of expression of VGAM2150 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2150 correlate with, and may be deduced from, the identity of the target genes which VGAM2150 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74411] Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM_000139) is a VGAM2150 host target gene. MS4A1 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by MS4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A1 BINDING SITE, designated SEQ ID:5635, to the nucleotide sequence of VGAM2150 RNA, herein designated VGAM RNA, also designated SEQ ID:4861.

[74412] A function of VGAM2150 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM_000139), a gene which may be involved in the regulation of b-cell activation and proliferation. Accordingly, utilities of VGAM2150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A1. The function of MS4A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM362.DKFZp434F1719 (Accession NM_032248) is another VGAM2150 host target gene. DKFZp434F1719 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434F1719, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434F1719 BINDING SITE, designated SEQ ID:25987, to the nucleotide sequence of VGAM2150 RNA, herein designated VGAM RNA, also designated SEQ ID:4861.

[74413] Another function of VGAM2150 is therefore inhibition of DKFZp434F1719 (Accession NM_032248). Accordingly, utilities of VGAM2150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F1719. FLJ14082 (Accession NM_025024) is another VGAM2150 host target gene. FLJ14082 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14082 BINDING SITE, designated SEQ ID:24607, to the nucleotide sequence of VGAM2150 RNA, herein designated VGAM RNA, also designated SEQ ID:4861.

[74414] Another function of VGAM2150 is therefore inhibition of FLJ14082 (Accession NM_025024). Accordingly, utilities of VGAM2150 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14082. KIAA0471 (Accession NM_014857) is another VGAM2150 host target gene. KIAA0471 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:16906, to the nucleotide sequence of VGAM2150 RNA, herein designated VGAM RNA, also designated SEQ ID:4861.

[74415] Another function of VGAM2150 is therefore inhibition of KIAA0471 (Accession NM_014857). Accordingly, utilities of VGAM2150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471. KIAA0523 (Accession XM_041964) is another VGAM2150 host target gene. KIAA0523 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0523 BINDING SITE, designated SEQ ID:33645, to the

nucleotide sequence of VGAM2150 RNA, herein designated VGAM RNA, also designated SEQ ID:4861.

[74416] Another function of VGAM2150 is therefore inhibition of KIAA0523 (Accession XM_041964). Accordingly, utilities of VGAM2150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0523. KIAA1674 (Accession XM_044065) is another VGAM2150 host target gene. KIAA1674 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1674 BINDING SITE, designated SEQ ID:34101, to the nucleotide sequence of VGAM2150 RNA, herein designated VGAM RNA, also designated SEQ ID:4861.

[74417] Another function of VGAM2150 is therefore inhibition of KIAA1674 (Accession XM_044065). Accordingly, utilities of VGAM2150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1674. KIAA1775 (Accession NM_033100) is another VGAM2150 host target gene. KIAA1775 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1775 BINDING SITE, designated SEQ ID:26939, to the nucleotide sequence of VGAM2150 RNA, herein designated VGAM RNA, also designated SEQ ID:4861.

[74418] Another function of VGAM2150 is therefore inhibition of KIAA1775 (Accession NM_033100). Accordingly, utilities of VGAM2150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1775. LOC145135 (Accession XM_096721) is another VGAM2150 host target gene. LOC145135 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145135 BINDING SITE, designated SEQ ID:40497, to the nucleotide sequence of VGAM2150 RNA, herein designated VGAM RNA, also designated SEQ ID:4861.

[74419] Another function of VGAM2150 is therefore inhibition of LOC145135 (Accession XM_096721). Accordingly, utilities

of VGAM2150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145135. LOC92285 (Accession XM_044051) is another VGAM2150 host target gene. LOC92285 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92285 BINDING SITE, designated SEQ ID:34094, to the nucleotide sequence of VGAM2150 RNA, herein designated VGAM RNA, also designated SEQ ID:4861.

[74420] Another function of VGAM2150 is therefore inhibition of LOC92285 (Accession XM_044051). Accordingly, utilities of VGAM2150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92285. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2151 (VGAM2151) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74421] VGAM2151 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2151 was detected is described hereinabove with reference to Figs. 1-8.

[74422] VGAM2151 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2151 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74423] VGAM2151 gene encodes a VGAM2151 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2151 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2151 precursor RNA is designated SEQ ID:2137, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2137 is located at position 54437 relative to the genome of Rana Tigrina Ranavirus.

[74424] VGAM2151 precursor RNA folds onto itself, forming VGAM2151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74425] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2151 folded precursor RNA into VGAM2151 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2151 RNA is designated SEQ ID:4862, and is provided hereinbelow with reference to the sequence listing part.

[74426] VGAM2151 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2151 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2151 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[74427] VGAM2151 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2151 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2151 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2151 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2151 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74428] The complementary binding of VGAM2151 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2151 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2151 host target RNA into VGAM2151 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74429] It is appreciated that VGAM2151 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2151 host target genes. The mRNA of each one of this plurality of VGAM2151 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2151 RNA, herein designated VGAM RNA, and which when bound by VGAM2151 RNA causes inhibition of translation of respective one or more VGAM2151 host target proteins.

[74430] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2151 gene, herein designated VGAM GENE, on one or more VGAM2151 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74431] It is yet further appreciated that a function of VGAM2151 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2151 correlate with, and may be deduced from, the identity of the host target genes which VGAM2151 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74432] Nucleotide sequences of the VGAM2151 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2151 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2151 are further described hereinbelow with reference to Table 1.

[74433] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2151 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2151 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74434] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2151 gene, herein designated VGAM is inhibition of expression of VGAM2151 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2151 correlate with, and may be deduced from, the identity of the target genes which VGAM2151 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74435] A Disintegrin and Metalloproteinase Domain 10 (ADAM10, Accession NM_001110) is a VGAM2151 host target gene.

ADAM10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ADAM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM10 BINDING SITE, designated SEQ ID:6768, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74436] A function of VGAM2151 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 10 (ADAM10, Accession NM_001110), a gene which Member of ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM10. The function of ADAM10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM706.ADP-ribosyltransferase (NAD+; poly (ADP-ribose) Polymerase) (ADPRT, Accession NM_001618) is another VGAM2151 host target gene. ADPRT BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ADPRT,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADPRT BINDING SITE, designated SEQ ID:7325, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74437] Another function of VGAM2151 is therefore inhibition of ADP-ribosyltransferase (NAD+; poly (ADP-ribose) Polymerase) (ADPRT, Accession NM_001618), a gene which catalyzes addition of mono-ADP-ribose to arginine residues of proteins, inhibits Pol II transcription. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADPRT. The function of ADPRT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM506.1-acylglycerol-3-phosphate O-acyltransferase 2 (lysophosphatidic acid acyltransferase, beta) (AGPAT2, Accession NM_006412) is another VGAM2151 host target gene. AGPAT2 BINDING SITE1 and AGPAT2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AGPAT2, corresponding to

HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGPAT2 BINDING SITE1 and AGPAT2 BINDING SITE2, designated SEQ ID:13118 and SEQ ID:32745 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74438] Another function of VGAM2151 is therefore inhibition of 1-acylglycerol-3-phosphate O-acyltransferase 2 (lysophosphatidic acid acyltransferase, beta) (AGPAT2, Accession NM_006412). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGPAT2. V-raf Murine Sarcoma 3611 Viral Oncogene Homolog 1 (ARAF1, Accession XM_033884) is another VGAM2151 host target gene. ARAF1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARAF1 BINDING SITE, designated SEQ ID:31982, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ

ID:4862.

[74439] Another function of VGAM2151 is therefore inhibition of V-raf Murine Sarcoma 3611 Viral Oncogene Homolog 1 (ARAF1, Accession XM_033884), a gene which may play a critical role in cell growth and development. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARAF1. The function of ARAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM996.Achaete-scute Complex-like 2 (Drosophila) (ASCL2, Accession XM_113673) is another VGAM2151 host target gene. ASCL2 BINDING SITE1 and ASCL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ASCL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASCL2 BINDING SITE1 and ASCL2 BINDING SITE2, designated SEQ ID:42324 and SEQ ID:11671 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74440] Another function of VGAM2151 is therefore inhibition of Achaete-scute Complex-like 2 (Drosophila) (ASCL2, Accession XM_113673), a gene which is involved in the determination of the neuronal precursors in the nervous system. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASCL2. The function of ASCL2 has been established by previous studies. The mammalian Achaete-Scute homologs are conserved mammalian cognates of the Drosophila Achaete-Scute complex. In rodents, 2 such genes have been identified: Mash1 (ASCL1; 100790) is expressed in neuronal progenita, while Mash2 (ASCL2) is expressed in spongiotrophoblast cells and their precursors. Both are members of the basic helix-loop-helix (bHLH) gene family, which includes MYC (OMIM Ref. No. 190080) and MYOD1 (OMIM Ref. No. 159970). Mash1 and Mash2 function as lineage-specific transcription factors essential for development of the neurectoderm and trophectoderm, respectively. Mice deficient for Mash2 die at 10 days postcoitum due to placental failure (Guillemot et al., 1994). In contrast, chimeric mice with heterozygous extraembryonic tissues and homozygous embryonic tissues are viable and normal, indicating that

this gene, although essential for development of a placenta, is not important for the development of the embryo proper. Alders et al. (1997) noted that in the mouse, the Mash2 gene is subject to genomic imprinting with only the maternal allele being active. Mice carrying the homozygously mutated Mash2 gene die at 10 days postcoitum, as do heterozygous mice who inherited the mutant allele from their mother. Heterozygous mice who inherited the mutant allele from their father are viable. This phenomenon of paternal imprinting of a gene being critical for development of a placenta is an exception to the common imprinting rule: nuclear transplantation studies in mice show that imprinting is biased toward embryonic versus extraembryonic tissues with preferential expression of the maternal and paternal alleles in the embryo and placenta, respectively. Mash2 in the mouse maps to distal chromosome 7 and is closely linked to 3 other imprinted genes, Ins2 (OMIM Ref. No. 176730), Igf2 (OMIM Ref. No. 147470), and H19 (OMIM Ref. No. 103280). The conserved syntenic human chromosome region is 11p15.5. Alders et al. (1997) took advantage of this fact to isolate the human homolog of the MASH2 gene, which they designated HASH2. They showed that the gene maps

proximal to, and in close proximity of, IGF2 and that the gene order in this region is HASH2-INS-IGF2-H19-tel. Expression studies showed that HASH2 is expressed in extravillus trophoblast cells only. The lack of expression in nonmalignant hydatidiform (androgenetic) moles indicated that HASH2 is also imprinted in man.

[74441] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[74442] Alders, M.; Hodges, M.; Hadjantonakis, A.-K.; Postmus, J.; van Wijk, I.; Bliek, J.; de Meulemeester, M.; Westerveld, A.; Guillemot, F.; Oudejans, C.; Little, P.; Mannens, M. : The human Achaete-Scute homologue 2 (ASCL2,HASH2) maps to chromosome 11p15.5, close to IGF2 and is expressed in extravillus trophoblasts. Hum. Molec. Genet. 6: 859-867, 1997. ; and

[74443] Guillemot, F.; Nagy, A.; Auerbach, A.; Rossant, J.; Joyner, A. L. : Essential role of Mash-2 in extraembryonic development. Nature 371: 333-336, 1994.

[74444] Further studies establishing the function and utilities of ASCL2 are found in John Hopkins OMIM database record ID 601886, and in sited publications numbered 6701-6702 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference.B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_138576) is another VGAM2151 host target gene. BCL11B BINDING SITE1 and BCL11B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BCL11B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE1 and BCL11B BINDING SITE2, designated SEQ ID:28891 and SEQ ID:23167 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74445] Another function of VGAM2151 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_138576). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Breakpoint Cluster Region (BCR, Accession NM_004327) is another VGAM2151 host target gene. BCR BINDING SITE1 and BCR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BCR, corresponding to HOST TARGET binding

sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCR BINDING SITE1 and BCR BINDING SITE2, designated SEQ ID:10527 and SEQ ID:31989 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74446] Another function of VGAM2151 is therefore inhibition of Breakpoint Cluster Region (BCR, Accession NM_004327), a gene which is a serine/threonine kinase that involves in the t(9;22) translocation (Philadelphia chromosome). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCR. The function of BCR has been established by previous studies. The normal BCR gene occupies a region of about 135 kb on chromosome 22. It is expressed as mRNAs of 4.5- and 6.7-kb, which apparently encode for the same cytoplasmic 160-kD protein, and contains 23 exons as well as an unusual inverted repeat flanking the first exon. The BCR protein reportedly contains a unique serine/threonine kinase activity and at least two SH2 binding sites encoded in its first exon and a C-terminal domain that functions as a GTPase activating

protein for p21(rac) (Diekmann et al., 1991); see rac serine/threonine protein kinase (OMIM Ref. No. 164730). Chissoe et al. (1995) sequenced the complete BCR gene and greater than 80% of the human ABL gene, which are both involved in the t(9;22) translocation (Philadelphia chromosome) associated with more than 90% of chronic myelogenous leukemia, 25 to 30% of adult and 2 to 10% of childhood acute lymphoblastic leukemia, and rare cases of acute myelogenous leukemia. Comparison of the gene with its cDNA sequence revealed the positions of 23 BCR exons and putative alternative BCR first and second exons. From the sequence of 4 newly studied Philadelphia chromosome translocations and a review of several other previously sequenced breakpoints, Chissoe et al. (1995) could discern no consistent breakpoint features. No clear-cut mechanism for Philadelphia chromosome translocation was evident. Because tyrosine kinase activity is essential to the transforming function of BCR-ABL, Druker et al. (2001) reasoned that an inhibitor of the kinase may be an effective treatment for CML. They found that indeed a tyrosine kinase inhibitor (OMIM Ref. No. STI571) was well tolerated and had significant antileukemic activity in patients with CML in whom treatment with standard

chemotherapy had failed. This experience demonstrated the potential for the development of anticancer drugs based on the specific molecular abnormality present in a human cancer. Animal model experiments lend further support to the function of BCR. Cancer is thought to arise from multiple genetic events that establish irreversible malignancy. A different mechanism might be present in certain leukemias initiated by a chromosomal translocation. Huettner et al. (2000) adopted a new approach to determine if ablation of the genetic abnormality is sufficient for reversion. They generated a conditional transgenic model of BCR-ABL-induced leukemia. The most common form of the product of the fusion gene, p210 BCR-ABL1, is found in more than 90% of patients with chronic myelogenous leukemia and in up to 15% of adult patients with de novo acute lymphoblastic leukemia. Efforts to establish a useful transgenic model had been hampered by embryonic lethality when the oncogene is expressed during embryogenesis, by reduced penetrance, or by extremely long latency. Huettner et al. (2000) used the 'knock-in' approach to induce leukemia by p190 BCR-ABL1 (Castellanos et al., 1997). Lethal leukemia developed within an acceptable time frame in all animals, and com-

plete remission was achieved by suppression of BCR-ABL1 expression, even after multiple rounds of induction and reversion. The results demonstrated that BCR-ABL1 is required for both induction and maintenance of leukemia. The findings suggested that complete and lasting remissions can be achieved if the genetic abnormality is abolished or silenced before secondary mutations are acquired. The results have implications for therapies that directly target leukemia oncogenes, with a relevant example being the use of BCR-ABL1-specific tyrosine kinase inhibitors.

[74447] It is appreciated that the abovementioned animal model for BCR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[74448] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[74449] Chissoe, S. L.; Bodenteich, A.; Wang, Y.-F.; Wang, Y.-P.; Burian, D.; Clifton, S. W.; Crabtree, J.; Freeman, A.; Iyer, K.; Jian, L.; Ma, Y.; McLaury, H.-J.; Pan, H.-Q.; Sarhan, O. H.; Toth, S.; Wang, Z.; Zhang, G.; Heisterkamp, N.; Groffen, J.; Roe, B. A. : Sequence and analysis of the human ABL gene,

the BCR gene, and regions involved in the Philadelphia chromosomal translocation. Genomics 27: 67-82, 1995. ; and

[74450] Huettner, C. S.; Zhang, P.; Van Etten, R. A.; Tenen, D. G. : Reversibility of acute B-cell leukaemia induced by BCR-ABL1. Nature Genet. 24: 57-60, 2000.

[74451] Further studies establishing the function and utilities of BCR are found in John Hopkins OMIM database record ID 151410, and in sited publications numbered 11081-11088, 11375-11092, 11411, 11412-11416, 3659, 11417-11427, 3104, 11428-11441, 1135 and 11475-11496 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Cadherin Related 23 (CDH23, Accession NM_052836) is another VGAM2151 host target gene. CDH23 BINDING SITE1 and CDH23 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CDH23, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH23 BINDING SITE1 and CDH23 BINDING SITE2, designated SEQ ID:27418 and SEQ ID:22670 respectively, to the nucleotide sequence of VGAM2151 RNA,

herein designated VGAM RNA, also designated SEQ ID:4862.

[74452] Another function of VGAM2151 is therefore inhibition of Cadherin Related 23 (CDH23, Accession NM_052836). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH23. DXYS155E (Accession NM_005088) is another VGAM2151 host target gene. DXYS155E BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DXYS155E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXYS155E BINDING SITE, designated SEQ ID:11541, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74453] Another function of VGAM2151 is therefore inhibition of DXYS155E (Accession NM_005088), a gene which may be involved in b-cell activation. may also be involved in signal transduction and gene regulation. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

DXYS155E. The function of DXYS155E and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM766.Engrailed Homolog 2 (EN2, Accession NM_001427) is another VGAM2151 host target gene. EN2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EN2 BINDING SITE, designated SEQ ID:7146, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74454] Another function of VGAM2151 is therefore inhibition of Engrailed Homolog 2 (EN2, Accession NM_001427), a gene which may be required for normal cerebellar development; a homeobox protein, very strongly similar to murine En2. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EN2. The function of EN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232.F-box

and Leucine-rich Repeat Protein 5 (FBXL5, Accession NM_033535) is another VGAM2151 host target gene. FBXL5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FBXL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL5 BINDING SITE, designated SEQ ID:27304, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74455] Another function of VGAM2151 is therefore inhibition of F-box and Leucine-rich Repeat Protein 5 (FBXL5, Accession NM_033535), a gene which is a putative SCF ubiquitin ligase subunit involved in protein degradation. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL5. The function of FBXL5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM61.F-box and Leucine-rich Repeat Protein 7 (FBXL7, Accession NM_012304) is another VGAM2151 host target gene. FBXL7 BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by FBXL7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL7 BINDING SITE, designated SEQ ID:14672, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74456] Another function of VGAM2151 is therefore inhibition of F-box and Leucine-rich Repeat Protein 7 (FBXL7, Accession NM_012304), a gene which may be involved in in phosphorylation-dependent ubiquitination. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL7. The function of FBXL7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1924.Forkhead Box D2 (FOXD2, Accession NM_004474) is another VGAM2151 host target gene. FOXD2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOXD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FOXD2 BINDING SITE, designated SEQ ID:10788, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74457] Another function of VGAM2151 is therefore inhibition of Forkhead Box D2 (FOXD2, Accession NM_004474). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXD2. Follistatin-like 1 (FSTL1, Accession NM_007085) is another VGAM2151 host target gene. FSTL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FSTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FSTL1 BINDING SITE, designated SEQ ID:13951, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74458] Another function of VGAM2151 is therefore inhibition of Follistatin-like 1 (FSTL1, Accession NM_007085), a gene which may modulate the action of some growth factors on cell proliferation and differentiation. Accordingly, utilities

of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL1. The function of FSTL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM791.HIR Histone Cell Cycle Regulation Defective Homolog A (S. cerevisiae) (HIRA, Accession NM_003325) is another VGAM2151 host target gene. HIRA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HIRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIRA BINDING SITE, designated SEQ ID:9326, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74459] Another function of VGAM2151 is therefore inhibition of HIR Histone Cell Cycle Regulation Defective Homolog A (S. cerevisiae) (HIRA, Accession NM_003325), a gene which could have a part in mechanisms of transcriptional regulation similar to that played by yeast hir1 and hir2 together. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with HIRA. The function of HIRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1259.Homeo Box A3 (HOXA3, Accession NM_030661) is another VGAM2151 host target gene. HOXA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOXA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXA3 BINDING SITE, designated SEQ ID:24994, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74460] Another function of VGAM2151 is therefore inhibition of Homeo Box A3 (HOXA3, Accession NM_030661). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA3. IQ Motif Containing GTPase Activating Protein 2 (IQGAP2, Accession NM_006633) is another VGAM2151 host target gene. IQGAP2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IQGAP2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IQGAP2 BINDING SITE, designated SEQ ID:13429, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74461] Another function of VGAM2151 is therefore inhibition of IQ Motif Containing GTPase Activating Protein 2 (IQGAP2, Accession NM_006633), a gene which Inhibits GTPase activity of Cdc42 and Rac1. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IQGAP2. The function of IQGAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM110.Integrin, Alpha M (complement component receptor 3, alpha; also known as CD11b (p170), Macrophage Antigen Alpha Polypeptide) (ITGAM, Accession NM_000632) is another VGAM2151 host target gene. ITGAM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of ITGAM BINDING SITE, designated SEQ ID:6250, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74462] Another function of VGAM2151 is therefore inhibition of Integrin, Alpha M (complement component receptor 3, alpha; also known as CD11b (p170), Macrophage Antigen Alpha Polypeptide) (ITGAM, Accession NM_000632), a gene which is invovled in various adhesive interactions of monocytes, macrophages and granulocytes as well as in mediating the uptake of complement-coated particles. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAM. The function of ITGAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1386.Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223) is another VGAM2151 host target gene. ITPR2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ITPR2, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR2 BINDING SITE, designated SEQ ID:7993, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74463] Another function of VGAM2151 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR2. Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM_012281) is another VGAM2151 host target gene. KCND2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND2 BINDING SITE, designated SEQ ID:14609, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74464] Another function of VGAM2151 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily,

Member 2 (KCND2, Accession NM_012281), a gene which is prominent in the repolarization phase of the action potential. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCND2. The function of KCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM449.LIM Domain Only 2 (rhombotin-like 1) (LMO2, Accession NM_005574) is another VGAM2151 host target gene. LMO2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LMO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMO2 BINDING SITE, designated SEQ ID:12103, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74465] Another function of VGAM2151 is therefore inhibition of LIM Domain Only 2 (rhombotin-like 1) (LMO2, Accession NM_005574). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO2. Mitogen-activated

Protein Kinase Kinase Kinase 5 (MAP3K5, Accession NM_005923) is another VGAM2151 host target gene. MAP3K5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAP3K5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K5 BINDING SITE, designated SEQ ID:12547, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74466] Another function of VGAM2151 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 5 (MAP3K5, Accession NM_005923), a gene which phosphorylates and activates two different subgroups of map kinase kinases, mkk4/sek1 and mkk3/mapkk6 (or mkk6) .overexpression induces apoptotic cell death. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K5. The function of MAP3K5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1622.Mitogen-activated Protein

Kinase Kinase Kinase 7 Interacting Protein 2 (MAP3K7IP2, Accession NM_015093) is another VGAM2151 host target gene. MAP3K7IP2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAP3K7IP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K7IP2 BINDING SITE, designated SEQ ID:17486, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74467] Another function of VGAM2151 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 2 (MAP3K7IP2, Accession NM_015093). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K7IP2. Mitogen-activated Protein Kinase Kinase Kinase Kinase 5 (MAP4K5, Accession NM_006575) is another VGAM2151 host target gene. MAP4K5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAP4K5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of MAP4K5 BINDING SITE, designated SEQ ID:13342, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74468] Another function of VGAM2151 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase Kinase 5 (MAP4K5, Accession NM_006575). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP4K5. Mannose-P-dolichol Utilization Defect 1 (MPDU1, Accession NM_004870) is another VGAM2151 host target gene. MPDU1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MPDU1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPDU1 BINDING SITE, designated SEQ ID:11298, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74469] Another function of VGAM2151 is therefore inhibition of Mannose-P-dolichol Utilization Defect 1 (MPDU1, Acces-

sion NM_004870), a gene which corrects the Lec15 mutant phenotype. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPDU1. The function of MPDU1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1187.8-oxoguanine DNA Glycosylase (OGG1, Accession NM_016819) is another VGAM2151 host target gene. OGG1 BINDING SITE1 through OGG1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OGG1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGG1 BINDING SITE1 through OGG1 BINDING SITE3, designated SEQ ID:18807, SEQ ID:18812 and SEQ ID:8390 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74470] Another function of VGAM2151 is therefore inhibition of 8-oxoguanine DNA Glycosylase (OGG1, Accession NM_016819), a gene which is involved in base excision DNA repair and removal of 8-oxyguanine. Accordingly,

utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGG1. The function of OGG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM390.Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823) is another VGAM2151 host target gene. PKIA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PKIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKIA BINDING SITE, designated SEQ ID:13702, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74471] Another function of VGAM2151 is therefore inhibition of Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKIA. POU Domain, Class 2, Transcription Factor 2 (POU2F2, Accession NM_002698) is another VGAM2151 host target

gene. POU2F2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POU2F2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU2F2 BINDING SITE, designated SEQ ID:8549, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74472] Another function of VGAM2151 is therefore inhibition of POU Domain, Class 2, Transcription Factor 2 (POU2F2, Accession NM_002698), a gene which activates immunoglobulin gene expression. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU2F2. The function of POU2F2 has been established by previous studies. An understanding of development necessitates an understanding of the molecular mechanisms of cell type-specific gene expression. Using synthetic promoter constructions, it has been found that 2 sequences within immunoglobulin promoters are sufficient for lymphoid-specific promoter activity: an octamer, ATTTGCAT, and a TATA box. Staudt et al. (1988) isolated a cDNA

which hybridized with mRNA transcripts that were largely restricted to lymphoid cells. The level of expression of the gene, termed OCT2, within different lymphoid cell lines correlated well with the amount of a nuclear factor called NFA2 that had previously been detected only in lymphoid cells. Ko et al. (1988) determined the DNA sequence of the OCT2 cDNA and showed that its gene product contains a homeobox. Site-directed mutagenesis of the homeobox domain abolished DNA binding. They demonstrated, furthermore, that the gene is located on chromosome 19, using hybridization to a panel of somatic cell hybrid DNAs. By linkage studies in an interspecific backcross and by studies of recombinant inbred strains, Siracusa et al. (1991) assigned the Otf2 gene to mouse chromosome 7. Whereas the Otf1 and Otf2 molecular probes recognize single loci, members of the Otf3 family map to mouse chromosomes 1, 2, 3, 6, 14, 17, and the X chromosome. Schubart et al. (2001) noted that Oct2-deficient mice die at birth but have normal B-cell development and transcription of immunoglobulin (Ig) genes. Oct-binding factor-1 (Obf1; 601206)-deficient mice are viable with unaffected B-cell development in bone marrow and normal serum IgM but have reduced B-cell numbers in spleen

and low serum IgG. By creating double knockout mice, Schubart et al. (2001) confirmed that B-cell development and Ig gene transcription can proceed normally without these B-cell specific factors. However, in these animals the mature B-cell pool was strongly reduced, suggesting that these factors play an important role in controlling the expansion and/or maintenance of mature B cells.

[74473] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[74474] Staudt, L. M.; Clerc, R. G.; Singh, H.; LeBowitz, J. H.; Sharp, P. A.; Baltimore, D. : Cloning of a lymphoid-specific cDNA encoding a protein binding the regulatory octamer DNA motif. Science 241: 577-580, 1988. ; and

[74475] Schubart, K.; Massa, S.; Schubart, D.; Corcoran, L. M.; Rolink, A. G.; Matthias, P. : B cell development and immunoglobulin gene transcription in the absence of Oct-2 and OBF-1. Nature Immu.

[74476] Further studies establishing the function and utilities of POU2F2 are found in John Hopkins OMIM database record ID 164176, and in sited publications numbered 1859, 10798-1079 and 10856 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence.Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Gamma Isoform (calcineurin A gamma) (PPP3CC, Accession NM_005605) is another VGAM2151 host target gene. PPP3CC BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PPP3CC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP3CC BINDING SITE, designated SEQ ID:12127, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74477] Another function of VGAM2151 is therefore inhibition of Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Gamma Isoform (calcineurin A gamma) (PPP3CC, Accession NM_005605). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP3CC. Phosphatase and Tensin Homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NM_000314) is another VGAM2151 host target gene. PTEN BINDING SITE1 through PTEN BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTEN,

corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTEN BINDING SITE1 through PTEN BINDING SITE5, designated SEQ ID:5854, SEQ ID:5855, SEQ ID:5856, SEQ ID:5857 and SEQ ID:5853 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74478] Another function of VGAM2151 is therefore inhibition of Phosphatase and Tensin Homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NM_000314). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTEN. Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM_080392) is another VGAM2151 host target gene. PTP4A2 BINDING SITE1 and PTP4A2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTP4A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTP4A2 BINDING SITE1 and PTP4A2 BINDING SITE2, designated SEQ ID:27830 and SEQ ID:34789 re-

spectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74479] Another function of VGAM2151 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM_080392), a gene which is a protein tyrosine phosphatase which has a C-terminal prenylation site. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A2. The function of PTP4A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217.RAD21 Homolog (S. pombe) (RAD21, Accession NM_006265) is another VGAM2151 host target gene. RAD21 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAD21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD21 BINDING SITE, designated SEQ ID:12946, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ

ID:4862.

[74480] Another function of VGAM2151 is therefore inhibition of RAD21 Homolog (S. pombe) (RAD21, Accession NM_006265), a gene which may act in double strand break repair. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD21. The function of RAD21 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1928.RALBP1 Associated Eps Domain Containing 2 (REPS2, Accession NM_004726) is another VGAM2151 host target gene. REPS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by REPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REPS2 BINDING SITE, designated SEQ ID:11098, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74481] Another function of VGAM2151 is therefore inhibition of RALBP1 Associated Eps Domain Containing 2 (REPS2, Ac-

cession NM_004726), a gene which interacts with the active form of RAS with adaptor protein GRB2 and binds calcium. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REPS2. The function of REPS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM709.Replication Factor C (activator 1) 4, 37kDa (RFC4, Accession NM_002916) is another VGAM2151 host target gene. RFC4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RFC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFC4 BINDING SITE, designated SEQ ID:8821, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74482] Another function of VGAM2151 is therefore inhibition of Replication Factor C (activator 1) 4, 37kDa (RFC4, Accession NM_002916), a gene which activates DNA polymerases for elongation of primed dna templates. Accord-

ingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFC4. The function of RFC4 has been established by previous studies. The elongation of primed DNA templates by DNA polymerase delta and DNA polymerase epsilon requires the action of 2 accessory proteins, proliferating cell nuclear antigen (PCNA; 176740) and activator 1 (A1; also called replication factor C). A1 is an enzyme that contains 5 different subunits of 140, 40, 38, 37, and 36 kD. Chen et al. (1992) isolated the gene encoding the 37-kD subunit from HeLa cells. The deduced amino acid sequence showed a high degree of homology to the 40-kD subunit of A1 but, unlike the 40-kD protein, the 37-kD expressed protein did not bind ATP. Other findings suggested that both the 37- and 40-kD subunits of A1 are required for the biologic role of A1 and that they may function differently in this process. See replication factor C, subunit 2 (RFC2; 600404). Wang et al. (2000) used immunoprecipitation and mass spectrometry analyses to identify BRCA1 (OMIM Ref. No. 113705)-associated proteins. They found that BRCA1 is part of a large multisubunit protein complex of tumor suppressors, DNA damage sensors, and signal transducers. They named this complex

BASC, for 'BRCA1-associated genome surveillance complex.' Among the DNA repair proteins identified in the complex were ATM (OMIM Ref. No. 208900), BLM (OMIM Ref. No. 604610), MSH2 (OMIM Ref. No. 120435), MSH6 (OMIM Ref. No. 600678), MLH1 (OMIM Ref. No. 120436), the RAD50 (OMIM Ref. No. 604040)-MRE11 (OMIM Ref. No. 600814)-NBS1 (OMIM Ref. No. 602667) complex, and the RFC1 (OMIM Ref. No. 102579)-RFC2-RFC4 complex. Wang et al. (2000) suggested that BASC may serve as a sensor of abnormal DNA structures and/or as a regulator of the postreplication repair process.

[74483] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[74484] Chen, M.; Pan, Z.-Q.; Hurwitz, J. : Studies of the cloned 37-kDa subunit of activator 1 (replication factor C) of HeLa cells. Proc. Nat. Acad. Sci. 89: 5211-5215, 1992. ; and

[74485] Wang, Y.; Cortez, D.; Yazdi, P.; Neff, N.; Elledge, S. J.; Qin, J. : BASC, a super complex of BRCA1-associated proteins involved in the recognition and repair of aberrant DNA structures.

[74486] Further studies establishing the function and utilities of

RFC4 are found in John Hopkins OMIM database record ID 102577, and in sited publications numbered 427 and 7117-7118 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.RGL (Accession NM_015149) is another VGAM2151 host target gene. RGL BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RGL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGL BINDING SITE, designated SEQ ID:17507, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74487] Another function of VGAM2151 is therefore inhibition of RGL (Accession NM_015149), a gene which is involved in nucleotide exchange factor. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGL. The function of RGL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM861.Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM_038377) is another

VGAM2151 host target gene. ROCK2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ROCK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROCK2 BINDING SITE, designated SEQ ID:32841, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74488] Another function of VGAM2151 is therefore inhibition of Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM_038377), a gene which regulates cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROCK2. The function of ROCK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM273.Tafazzin (cardiomyopathy, dilated 3A (X-linked); Endocardial Fibroelastosis 2; Barth Syndrome) (TAZ, Accession NM_015472) is another VGAM2151 host target gene. TAZ BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by TAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAZ BINDING SITE, designated SEQ ID:17753, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74489] Another function of VGAM2151 is therefore inhibition of Tafazzin (cardiomyopathy, dilated 3A (X-linked); Endocardial Fibroelastosis 2; Barth Syndrome) (TAZ, Accession NM_015472). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAZ. TRK-fused Gene (TFG, Accession NM_006070) is another VGAM2151 host target gene. TFG BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TFG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFG BINDING SITE, designated SEQ ID:12713, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74490] Another function of VGAM2151 is therefore inhibition of TRK-fused Gene (TFG, Accession NM_006070), a gene which is a chimeric protein that forms multimeric complexes in vivo. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFG. The function of TFG has been established by previous studies. See 188550. Greco et al. (1995) stated that approximately 50% of papillary thyroid carcinomas are associated with rearrangements of the RET (OMIM Ref. No. 164761) and NTRK1 (OMIM Ref. No. 191315) transmembrane receptor tyrosine kinase protooncogenes. The rearrangements juxtapose the tyrosine kinase domain to 5-prime sequences from unrelated loci, yielding chimeric proteins with ectopic, constitutive tyrosine kinase activity. In one tumor, Greco et al. (1995) found a chimeric oncogene, designated TRKT3, in which 1,412 nucleotides of NTRK1 are fused to 598 nucleotides from a novel gene called TFG (TRK-fused gene). TRKT3 encodes a predicted 592-amino acid chimeric protein that forms multimeric complexes in vivo. Mencinger et al. (1997) identified the complete TFG gene by searching for ESTs that were similar to the N-terminal regions of EWS (OMIM Ref. No. 133450) and FUS (OMIM

Ref. No. 137070). TFG encodes a predicted 400-amino acid protein with a putative N-terminal coiled-coil region. On Northern blots, the 2.2-kb TFG mRNA was expressed in all tissues tested. Greco et al. (1995) stated that a coiled-coil structure and ubiquitous expression are features shared by all NTRK1-activating genes as well as genes that activate other tyrosine kinase protooncogenes.

[74491] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[74492] Greco, A.; Mariani, C.; Miranda, C.; Lupas, A.; Pagliardini, S.; Pomati, M.; Pierotti, M. A. : The DNA rearrangement that generates the TRK-T3 oncogene involves a novel gene on chromosome 3 whose product has a potential coiled-coil domain. Molec. Cell Biol. 15: 6118-6127, 1995. ; and

[74493] Mencinger, M.; Panagopoulos, I.; Andreasson, P.; Lassen, C.; Mitelman, F.; Aman, P. : Characterization and chromosomal mapping of the human TFG gene involved in thyroid carcinoma. Genom.

[74494] Further studies establishing the function and utilities of TFG are found in John Hopkins OMIM database record ID 602498, and in sited publications numbered 8252-8253

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Translin (TSN, Accession NM_004622) is another VGAM2151 host target gene. TSN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSN BINDING SITE, designated SEQ ID:10986, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74495] Another function of VGAM2151 is therefore inhibition of Translin (TSN, Accession NM_004622), a gene which is a DNA binding protein and involved in DNA repair, replication, or recombination. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSN. The function of TSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM98.Wolf-Hirschhorn Syndrome Candidate 1-like 1 (WHSC1L1, Accession NM_017778) is another VGAM2151 host target gene. WHSC1L1 BINDING SITE1 and WHSC1L1

BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1L1 BINDING SITE1 and WHSC1L1 BINDING SITE2, designated SEQ ID:19410 and SEQ ID:23317 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74496] Another function of VGAM2151 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1-like 1 (WHSC1L1, Accession NM_017778), a gene which restores repair of base-base and single- nucleotide insertion-deletion mismatches, and increases the proficiency to process heteroduplexes with insertion-deletion mismatches. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1L1. The function of WHSC1L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475.Zinc Finger Protein 6 (CMPX1) (ZNF6, Accession NM_021998) is another VGAM2151 host target gene. ZNF6 BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF6 BINDING SITE, designated SEQ ID:22536, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74497] Another function of VGAM2151 is therefore inhibition of Zinc Finger Protein 6 (CMPX1) (ZNF6, Accession NM_021998). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF6. BDG-29 (Accession XM_051343) is another VGAM2151 host target gene. BDG-29 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BDG-29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BDG-29 BINDING SITE, designated SEQ ID:35818, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74498] Another function of VGAM2151 is therefore inhibition of BDG-29 (Accession XM_051343). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDG-29. C3IP1 (Accession NM_021633) is another VGAM2151 host target gene. C3IP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C3IP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C3IP1 BINDING SITE, designated SEQ ID:22276, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74499] Another function of VGAM2151 is therefore inhibition of C3IP1 (Accession NM_021633). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3IP1. CASPR3 (Accession NM_033655) is another VGAM2151 host target gene. CASPR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CASPR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASPR3 BINDING SITE, designated SEQ ID:27384, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74500] Another function of VGAM2151 is therefore inhibition of CASPR3 (Accession NM_033655). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASPR3. Centaurin, Gamma 2 (CENTG2, Accession NM_014914) is another VGAM2151 host target gene. CENTG2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CENTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTG2 BINDING SITE, designated SEQ ID:17160, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74501] Another function of VGAM2151 is therefore inhibition of Centaurin, Gamma 2 (CENTG2, Accession NM_014914). Accordingly, utilities of VGAM2151 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with CENTG2. COASTER (Accession NM_015555) is another VGAM2151 host target gene. COASTER BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by COASTER, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COASTER BINDING SITE, designated SEQ ID:17823, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74502] Another function of VGAM2151 is therefore inhibition of COASTER (Accession NM_015555). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COASTER. Collagen, Type IV, Alpha 3 (Goodpasture antigen) Binding Protein (COL4A3BP, Accession NM_005713) is another VGAM2151 host target gene. COL4A3BP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by COL4A3BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of COL4A3BP BINDING SITE, designated SEQ ID:12267, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74503] Another function of VGAM2151 is therefore inhibition of Collagen, Type IV, Alpha 3 (Goodpasture antigen) Binding Protein (COL4A3BP, Accession NM_005713). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A3BP. D123 (Accession NM_006023) is another VGAM2151 host target gene. D123 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by D123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D123 BINDING SITE, designated SEQ ID:12641, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74504] Another function of VGAM2151 is therefore inhibition of D123 (Accession NM_006023). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D123.

Death-associated Protein Kinase 2 (DAPK2, Accession NM_014326) is another VGAM2151 host target gene. DAPK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAPK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAPK2 BINDING SITE, designated SEQ ID:15635, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74505] Another function of VGAM2151 is therefore inhibition of Death-associated Protein Kinase 2 (DAPK2, Accession NM_014326). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPK2. DKFZP434M154 (Accession XM_051330) is another VGAM2151 host target gene. DKFZP434M154 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434M154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434M154

BINDING SITE, designated SEQ ID:35808, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74506] Another function of VGAM2151 is therefore inhibition of DKFZP434M154 (Accession XM_051330). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434M154. DKFZp434O0320 (Accession XM_097012) is another VGAM2151 host target gene. DKFZp434O0320 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434O0320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434O0320 BINDING SITE, designated SEQ ID:40707, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74507] Another function of VGAM2151 is therefore inhibition of DKFZp434O0320 (Accession XM_097012). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434O0320. DKFZP566K1924 (Accession

XM_057469) is another VGAM2151 host target gene. DKFZP566K1924 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP566K1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K1924 BINDING SITE, designated SEQ ID:36521, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74508] Another function of VGAM2151 is therefore inhibition of DKFZP566K1924 (Accession XM_057469). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K1924. Dlc2 (Accession NM_080677) is another VGAM2151 host target gene. Dlc2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by Dlc2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Dlc2 BINDING SITE, designated SEQ ID:27970, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA,

also designated SEQ ID:4862.

[74509] Another function of VGAM2151 is therefore inhibition of Dlc2 (Accession NM_080677). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Dlc2. EHM2 (Accession NM_019114) is another VGAM2151 host target gene. EHM2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EHM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHM2 BINDING SITE, designated SEQ ID:21188, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74510] Another function of VGAM2151 is therefore inhibition of EHM2 (Accession NM_019114). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHM2. ELKS (Accession NM_015064) is another VGAM2151 host target gene. ELKS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ELKS, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELKS BINDING SITE, designated SEQ ID:17421, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74511] Another function of VGAM2151 is therefore inhibition of ELKS (Accession NM_015064). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELKS. EZFIT (Accession NM_021216) is another VGAM2151 host target gene. EZFIT BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EZFIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EZFIT BINDING SITE, designated SEQ ID:22196, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74512] Another function of VGAM2151 is therefore inhibition of EZFIT (Accession NM_021216). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with EZFIT. Fem-1 Homolog B (C. elegans) (FEM1B, Accession NM_015322) is another VGAM2151 host target gene. FEM1B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FEM1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEM1B BINDING SITE, designated SEQ ID:17642, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74513] Another function of VGAM2151 is therefore inhibition of Fem-1 Homolog B (C. elegans) (FEM1B, Accession NM_015322). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEM1B. FLJ10101 (Accession NM_024718) is another VGAM2151 host target gene. FLJ10101 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ10101 BINDING SITE, designated SEQ ID:24049, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74514] Another function of VGAM2151 is therefore inhibition of FLJ10101 (Accession NM_024718). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10101. FLJ10244 (Accession NM_018037) is another VGAM2151 host target gene. FLJ10244 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10244, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10244 BINDING SITE, designated SEQ ID:19781, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74515] Another function of VGAM2151 is therefore inhibition of FLJ10244 (Accession NM_018037). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10244. FLJ12076 (Accession NM_025187) is another

VGAM2151 host target gene. FLJ12076 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12076 BINDING SITE, designated SEQ ID:24824, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74516] Another function of VGAM2151 is therefore inhibition of FLJ12076 (Accession NM_025187). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12076. FLJ13204 (Accession NM_024761) is another VGAM2151 host target gene. FLJ13204 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13204 BINDING SITE, designated SEQ ID:24117, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74517] Another function of VGAM2151 is therefore inhibition of FLJ13204 (Accession NM_024761). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13204. FLJ13621 (Accession NM_025009) is another VGAM2151 host target gene. FLJ13621 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13621, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13621 BINDING SITE, designated SEQ ID:24581, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74518] Another function of VGAM2151 is therefore inhibition of FLJ13621 (Accession NM_025009). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13621. FLJ14356 (Accession NM_030824) is another VGAM2151 host target gene. FLJ14356 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14356 BINDING SITE, designated SEQ ID:25153, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74519] Another function of VGAM2151 is therefore inhibition of FLJ14356 (Accession NM_030824). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14356. FLJ20080 (Accession NM_017657) is another VGAM2151 host target gene. FLJ20080 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20080, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20080 BINDING SITE, designated SEQ ID:19180, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74520] Another function of VGAM2151 is therefore inhibition of FLJ20080 (Accession NM_017657). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20080. FLJ20435 (Accession NM_017821) is another VGAM2151 host target gene. FLJ20435 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20435 BINDING SITE, designated SEQ ID:19471, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74521] Another function of VGAM2151 is therefore inhibition of FLJ20435 (Accession NM_017821). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20435. FLJ20718 (Accession NM_017939) is another VGAM2151 host target gene. FLJ20718 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20718 BINDING SITE, designated SEQ ID:19635, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM

RNA, also designated SEQ ID:4862.

[74522] Another function of VGAM2151 is therefore inhibition of FLJ20718 (Accession NM_017939). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20718. FLJ22393 (Accession NM_025106) is another VGAM2151 host target gene. FLJ22393 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22393 BINDING SITE, designated SEQ ID:24756, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74523] Another function of VGAM2151 is therefore inhibition of FLJ22393 (Accession NM_025106). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22393. FLJ22405 (Accession NM_022485) is another VGAM2151 host target gene. FLJ22405 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22405, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22405 BINDING SITE, designated SEQ ID:22866, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74524] Another function of VGAM2151 is therefore inhibition of FLJ22405 (Accession NM_022485). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22405. FLJ22457 (Accession NM_024901) is another VGAM2151 host target gene. FLJ22457 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22457 BINDING SITE, designated SEQ ID:24389, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74525] Another function of VGAM2151 is therefore inhibition of FLJ22457 (Accession NM_024901). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ22457. Fused Toes Homolog (mouse) (FTS, Accession NM_022476) is another VGAM2151 host target gene. FTS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FTS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FTS BINDING SITE, designated SEQ ID:22843, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74526] Another function of VGAM2151 is therefore inhibition of Fused Toes Homolog (mouse) (FTS, Accession NM_022476). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FTS. GDBR1 (Accession NM_016172) is another VGAM2151 host target gene. GDBR1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GDBR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDBR1 BINDING SITE, designated SEQ

ID:18262, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74527] Another function of VGAM2151 is therefore inhibition of GDBR1 (Accession NM_016172). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDBR1. HSPC195 (Accession XM_087785) is another VGAM2151 host target gene. HSPC195 BINDING SITE1 and HSPC195 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HSPC195, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC195 BINDING SITE1 and HSPC195 BINDING SITE2, designated SEQ ID:39424 and SEQ ID:39423 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74528] Another function of VGAM2151 is therefore inhibition of HSPC195 (Accession XM_087785). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC195. Insulin-like Growth Factor 2, Antisense (IGF2AS,

Accession NM_016412) is another VGAM2151 host target gene. IGF2AS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IGF2AS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGF2AS BINDING SITE, designated SEQ ID:18541, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74529] Another function of VGAM2151 is therefore inhibition of Insulin-like Growth Factor 2, Antisense (IGF2AS, Accession NM_016412). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF2AS. Inositol 1,3,4-triphosphate 5/6 Kinase (ITPK1, Accession NM_014216) is another VGAM2151 host target gene. ITPK1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ITPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPK1 BINDING SITE, designated SEQ ID:15482,

to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74530] Another function of VGAM2151 is therefore inhibition of Inositol 1,3,4-triphosphate 5/6 Kinase (ITPK1, Accession NM_014216). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPK1. JIK (Accession NM_016281) is another VGAM2151 host target gene. JIK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by JIK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JIK BINDING SITE, designated SEQ ID:18406, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74531] Another function of VGAM2151 is therefore inhibition of JIK (Accession NM_016281). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JIK. KIAA0191 (Accession XM_038288) is another VGAM2151 host target gene. KIAA0191 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by KIAA0191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0191 BINDING SITE, designated SEQ ID:32788, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74532] Another function of VGAM2151 is therefore inhibition of KIAA0191 (Accession XM_038288). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0191. KIAA0210 (Accession NM_014744) is another VGAM2151 host target gene. KIAA0210 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0210 BINDING SITE, designated SEQ ID:16426, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74533] Another function of VGAM2151 is therefore inhibition of KIAA0210 (Accession NM_014744). Accordingly, utilities

of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0210. KIAA0227 (Accession XM_027236) is another VGAM2151 host target gene. KIAA0227 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0227 BINDING SITE, designated SEQ ID:30454, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74534] Another function of VGAM2151 is therefore inhibition of KIAA0227 (Accession XM_027236). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0227. KIAA0544 (Accession XM_048119) is another VGAM2151 host target gene. KIAA0544 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0544, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0544 BINDING SITE, designated SEQ ID:35115, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74535] Another function of VGAM2151 is therefore inhibition of KIAA0544 (Accession XM_048119). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0544. KIAA0607 (Accession XM_051931) is another VGAM2151 host target gene. KIAA0607 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0607 BINDING SITE, designated SEQ ID:35926, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74536] Another function of VGAM2151 is therefore inhibition of KIAA0607 (Accession XM_051931). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0607. KIAA0701 (Accession XM_045423) is another VGAM2151 host target gene. KIAA0701 BINDING SITE1

and KIAA0701 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0701, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0701 BINDING SITE1 and KIAA0701 BINDING SITE2, designated SEQ ID:34458 and SEQ ID:34459 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74537] Another function of VGAM2151 is therefore inhibition of KIAA0701 (Accession XM_045423). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0701. KIAA0721 (Accession NM_021648) is another VGAM2151 host target gene. KIAA0721 BINDING SITE1 and KIAA0721 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0721, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0721 BINDING SITE1 and KIAA0721 BINDING SITE2, designated SEQ ID:22321 and SEQ

ID:36066 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74538] Another function of VGAM2151 is therefore inhibition of KIAA0721 (Accession NM_021648). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0721. KIAA1233 (Accession XM_032181) is another VGAM2151 host target gene. KIAA1233 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1233 BINDING SITE, designated SEQ ID:31591, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74539] Another function of VGAM2151 is therefore inhibition of KIAA1233 (Accession XM_032181). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1233. KIAA1322 (Accession XM_052626) is another VGAM2151 host target gene. KIAA1322 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36031, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74540] Another function of VGAM2151 is therefore inhibition of KIAA1322 (Accession XM_052626). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1322. KIAA1822 (Accession XM_041566) is another VGAM2151 host target gene. KIAA1822 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1822 BINDING SITE, designated SEQ ID:33553, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74541] Another function of VGAM2151 is therefore inhibition of

KIAA1822 (Accession XM_041566). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1822. KIAA1940 (Accession XM_086981) is another VGAM2151 host target gene. KIAA1940 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1940 BINDING SITE, designated SEQ ID:39008, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74542] Another function of VGAM2151 is therefore inhibition of KIAA1940 (Accession XM_086981). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1940. KIAA1987 (Accession XM_113870) is another VGAM2151 host target gene. KIAA1987 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:42499, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74543] Another function of VGAM2151 is therefore inhibition of KIAA1987 (Accession XM_113870). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1987. Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117) is another VGAM2151 host target gene. KLHL4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KLHL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL4 BINDING SITE, designated SEQ ID:21192, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74544] Another function of VGAM2151 is therefore inhibition of Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with KLHL4. LSR68 (Accession NM_018678) is another VGAM2151 host target gene. LSR68 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LSR68, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LSR68 BINDING SITE, designated SEQ ID:20752, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74545] Another function of VGAM2151 is therefore inhibition of LSR68 (Accession NM_018678). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LSR68. Mesoderm Development Candidate 1 (MESDC1, Accession NM_022566) is another VGAM2151 host target gene. MESDC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MESDC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MESDC1 BINDING SITE, designated SEQ

ID:22883, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74546] Another function of VGAM2151 is therefore inhibition of Mesoderm Development Candidate 1 (MESDC1, Accession NM_022566). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MESDC1. MGC11296 (Accession NM_032352) is another VGAM2151 host target gene. MGC11296 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC11296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11296 BINDING SITE, designated SEQ ID:26141, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74547] Another function of VGAM2151 is therefore inhibition of MGC11296 (Accession NM_032352). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11296. MGC11324 (Accession NM_032717) is an-

other VGAM2151 host target gene. MGC11324 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC11324, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11324 BINDING SITE, designated SEQ ID:26445, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74548] Another function of VGAM2151 is therefore inhibition of MGC11324 (Accession NM_032717). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11324. MGC26684 (Accession NM_144568) is another VGAM2151 host target gene. MGC26684 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC26684, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26684 BINDING SITE, designated SEQ ID:29373, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74549] Another function of VGAM2151 is therefore inhibition of MGC26684 (Accession NM_144568). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26684. MGC3265 (Accession NM_024028) is another VGAM2151 host target gene. MGC3265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3265 BINDING SITE, designated SEQ ID:23459, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74550] Another function of VGAM2151 is therefore inhibition of MGC3265 (Accession NM_024028). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3265. MGC4368 (Accession NM_024510) is another VGAM2151 host target gene. MGC4368 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC4368, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4368 BINDING SITE, designated SEQ ID:23701, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74551] Another function of VGAM2151 is therefore inhibition of MGC4368 (Accession NM_024510). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4368. MIR (Accession XM_165739) is another VGAM2151 host target gene. MIR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MIR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIR BINDING SITE, designated SEQ ID:43739, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74552] Another function of VGAM2151 is therefore inhibition of MIR (Accession XM_165739). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIR.

Myelin Protein Zero-like 1 (MPZL1, Accession NM_003953) is another VGAM2151 host target gene. MPZL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MPZL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPZL1 BINDING SITE, designated SEQ ID:10088, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74553] Another function of VGAM2151 is therefore inhibition of Myelin Protein Zero-like 1 (MPZL1, Accession NM_003953). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPZL1. MY014 (Accession NM_030918) is another VGAM2151 host target gene. MY014 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MY014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MY014 BINDING SITE, designated SEQ ID:25191, to the nucleotide sequence of VGAM2151 RNA,

herein designated VGAM RNA, also designated SEQ ID:4862.

[74554] Another function of VGAM2151 is therefore inhibition of MY014 (Accession NM_030918). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MY014. Nuclear Receptor Co-repressor 1 (NCOR1, Accession NM_006311) is another VGAM2151 host target gene. NCOR1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NCOR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOR1 BINDING SITE, designated SEQ ID:13002, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74555] Another function of VGAM2151 is therefore inhibition of Nuclear Receptor Co-repressor 1 (NCOR1, Accession NM_006311). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOR1. Netrin 4 (NTN4, Accession XM_031896) is another VGAM2151 host target

gene. NTN4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTN4 BINDING SITE, designated SEQ ID:31515, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74556] Another function of VGAM2151 is therefore inhibition of Netrin 4 (NTN4, Accession XM_031896). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTN4. Nucleoredoxin (NXN, Accession NM_022463) is another VGAM2151 host target gene. NXN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXN BINDING SITE, designated SEQ ID:22811, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74557] Another function of VGAM2151 is therefore inhibition of

Nucleoredoxin (NXN, Accession NM_022463). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXN. Olfactory Receptor, Family 2, Subfamily C, Member 3 (OR2C3, Accession XM_060575) is another VGAM2151 host target gene. OR2C3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OR2C3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OR2C3 BINDING SITE, designated SEQ ID:37175, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74558] Another function of VGAM2151 is therefore inhibition of Olfactory Receptor, Family 2, Subfamily C, Member 3 (OR2C3, Accession XM_060575). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OR2C3. Oxysterol Binding Protein-like 5 (OSBPL5, Accession XM_052567) is another VGAM2151 host target gene. OSBPL5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL5,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL5 BINDING SITE, designated SEQ ID:35990, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74559] Another function of VGAM2151 is therefore inhibition of Oxysterol Binding Protein-like 5 (OSBPL5, Accession XM_052567). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL5. P5-1 (Accession NM_006674) is another VGAM2151 host target gene. P5-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P5-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P5-1 BINDING SITE, designated SEQ ID:13499, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74560] Another function of VGAM2151 is therefore inhibition of P5-1 (Accession NM_006674). Accordingly, utilities of

VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P5-1. P300/CBP-associated Factor (PCAF, Accession NM_003884) is another VGAM2151 host target gene. PCAF BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCAF BINDING SITE, designated SEQ ID:9964, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74561] Another function of VGAM2151 is therefore inhibition of P300/CBP-associated Factor (PCAF, Accession NM_003884). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCAF. Proprotein Convertase Subtilisin/kexin Type 7 (PCSK7, Accession NM_004716) is another VGAM2151 host target gene. PCSK7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCSK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of PCSK7 BINDING SITE, designated SEQ ID:11076, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74562] Another function of VGAM2151 is therefore inhibition of Proprotein Convertase Subtilisin/kexin Type 7 (PCSK7, Accession NM_004716). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCSK7. Programmed Cell Death 7 (PDCD7, Accession XM_050977) is another VGAM2151 host target gene. PDCD7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDCD7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDCD7 BINDING SITE, designated SEQ ID:35696, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74563] Another function of VGAM2151 is therefore inhibition of Programmed Cell Death 7 (PDCD7, Accession XM_050977). Accordingly, utilities of VGAM2151 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PDCD7. PEGASUS (Accession NM_022466) is another VGAM2151 host target gene. PEGASUS BINDING SITE1 and PEGASUS BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PEGASUS, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEGASUS BINDING SITE1 and PEGASUS BINDING SITE2, designated SEQ ID:22814 and SEQ ID:22815 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74564] Another function of VGAM2151 is therefore inhibition of PEGASUS (Accession NM_022466). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEGASUS. PF1 (Accession XM_170828) is another VGAM2151 host target gene. PF1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of PF1 BINDING SITE, designated SEQ ID:45604, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74565] Another function of VGAM2151 is therefore inhibition of PF1 (Accession XM_170828). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PF1. PPI5PIV (Accession NM_019892) is another VGAM2151 host target gene. PPI5PIV BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPI5PIV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPI5PIV BINDING SITE, designated SEQ ID:21277, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74566] Another function of VGAM2151 is therefore inhibition of PPI5PIV (Accession NM_019892). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPI5PIV. Protein Tyrosine Phosphatase, Non-receptor Type Sub-

strate 1 (PTPNS1, Accession NM_080792) is another VGAM2151 host target gene. PTPNS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPNS1 BINDING SITE, designated SEQ ID:28056, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74567] Another function of VGAM2151 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPNS1. PTR4 (Accession XM_058546) is another VGAM2151 host target gene. PTR4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTR4 BINDING SITE, designated SEQ ID:36654, to the nucleotide sequence of

VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74568] Another function of VGAM2151 is therefore inhibition of PTR4 (Accession XM_058546). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTR4. RPH3A (Accession NM_014954) is another VGAM2151 host target gene. RPH3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPH3A BINDING SITE, designated SEQ ID:17307, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74569] Another function of VGAM2151 is therefore inhibition of RPH3A (Accession NM_014954). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPH3A. Solute Carrier Family 21 (organic anion transporter), Member 11 (SLC21A11, Accession XM_035268) is another VGAM2151 host target gene. SLC21A11 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC21A11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A11 BINDING SITE, designated SEQ ID:32208, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74570] Another function of VGAM2151 is therefore inhibition of Solute Carrier Family 21 (organic anion transporter), Member 11 (SLC21A11, Accession XM_035268). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A11. Slit Homolog 1 (Drosophila) (SLIT1, Accession NM_003061) is another VGAM2151 host target gene. SLIT1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLIT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLIT1 BINDING SITE, designated SEQ ID:9030, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74571] Another function of VGAM2151 is therefore inhibition of Slit Homolog 1 (Drosophila) (SLIT1, Accession NM_003061). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLIT1. Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM_003131) is another VGAM2151 host target gene. SRF BINDING SITE1 and SRF BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SRF, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRF BINDING SITE1 and SRF BINDING SITE2, designated SEQ ID:9101 and SEQ ID:9102 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74572] Another function of VGAM2151 is therefore inhibition of Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM_003131). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRF. Serine Threonine Kinase 39

(STE20/SPS1 homolog, yeast) (STK39, Accession NM_013233) is another VGAM2151 host target gene. STK39 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by STK39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK39 BINDING SITE, designated SEQ ID:14894, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74573] Another function of VGAM2151 is therefore inhibition of Serine Threonine Kinase 39 (STE20/SPS1 homolog, yeast) (STK39, Accession NM_013233). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK39. TU12B1-TY (Accession NM_016575) is another VGAM2151 host target gene. TU12B1-TY BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TU12B1-TY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

TU12B1-TY BINDING SITE, designated SEQ ID:18649, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74574] Another function of VGAM2151 is therefore inhibition of TU12B1-TY (Accession NM_016575). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU12B1-TY. TUSP (Accession NM_020245) is another VGAM2151 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21530, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74575] Another function of VGAM2151 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. Unc-51-like Kinase 2 (C. elegans) (ULK2, Accession NM_014683) is another VGAM2151 host target gene.

ULK2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ULK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ULK2 BINDING SITE, designated SEQ ID:16182, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74576] Another function of VGAM2151 is therefore inhibition of Unc-51-like Kinase 2 (C. elegans) (ULK2, Accession NM_014683). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ULK2. WIT-1 (Accession NM_015855) is another VGAM2151 host target gene. WIT-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WIT-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WIT-1 BINDING SITE, designated SEQ ID:17991, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74577] Another function of VGAM2151 is therefore inhibition of

WIT-1 (Accession NM_015855). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WIT-1. Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM_016598) is another VGAM2151 host target gene. ZDHHC3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZDHHC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC3 BINDING SITE, designated SEQ ID:18689, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74578] Another function of VGAM2151 is therefore inhibition of Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM_016598). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC3. ZF (Accession NM_021212) is another VGAM2151 host target gene. ZF BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZF, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZF BINDING SITE, designated SEQ ID:22191, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74579] Another function of VGAM2151 is therefore inhibition of ZF (Accession NM_021212). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZF. Zinc Finger Protein 238 (ZNF238, Accession NM_006352) is another VGAM2151 host target gene. ZNF238 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF238 BINDING SITE, designated SEQ ID:13044, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74580] Another function of VGAM2151 is therefore inhibition of Zinc Finger Protein 238 (ZNF238, Accession NM_006352). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with ZNF238. ZTL1 (Accession NM_024055) is another VGAM2151 host target gene. ZTL1 BINDING SITE1 and ZTL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZTL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZTL1 BINDING SITE1 and ZTL1 BINDING SITE2, designated SEQ ID:23492 and SEQ ID:23188 respectively, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74581] Another function of VGAM2151 is therefore inhibition of ZTL1 (Accession NM_024055). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZTL1. LOC118851 (Accession XM_061180) is another VGAM2151 host target gene. LOC118851 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC118851, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC118851 BINDING SITE, designated SEQ ID:37202, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74582] Another function of VGAM2151 is therefore inhibition of LOC118851 (Accession XM_061180). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118851. LOC121536 (Accession XM_058567) is another VGAM2151 host target gene. LOC121536 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC121536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121536 BINDING SITE, designated SEQ ID:36665, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74583] Another function of VGAM2151 is therefore inhibition of LOC121536 (Accession XM_058567). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121536. LOC122553 (Accession XM_058630) is another VGAM2151 host target gene. LOC122553 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC122553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122553 BINDING SITE, designated SEQ ID:36690, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74584] Another function of VGAM2151 is therefore inhibition of LOC122553 (Accession XM_058630). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122553. LOC122792 (Accession NM_145251) is another VGAM2151 host target gene. LOC122792 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC122792, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122792 BINDING SITE, designated SEQ ID:29764, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74585] Another function of VGAM2151 is therefore inhibition of

LOC122792 (Accession NM_145251). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122792. LOC125228 (Accession XM_058913) is another VGAM2151 host target gene. LOC125228 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC125228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125228 BINDING SITE, designated SEQ ID:36792, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74586] Another function of VGAM2151 is therefore inhibition of LOC125228 (Accession XM_058913). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125228. LOC126432 (Accession XM_059046) is another VGAM2151 host target gene. LOC126432 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC126432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC126432 BINDING SITE, designated SEQ ID:36842, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74587] Another function of VGAM2151 is therefore inhibition of LOC126432 (Accession XM_059046). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126432. LOC134553 (Accession XM_059723) is another VGAM2151 host target gene. LOC134553 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC134553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134553 BINDING SITE, designated SEQ ID:37077, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74588] Another function of VGAM2151 is therefore inhibition of LOC134553 (Accession XM_059723). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134553. LOC146057 (Accession XM_085302) is an-

other VGAM2151 host target gene. LOC146057 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146057 BINDING SITE, designated SEQ ID:38058, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74589] Another function of VGAM2151 is therefore inhibition of LOC146057 (Accession XM_085302). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146057. LOC146439 (Accession XM_085463) is another VGAM2151 host target gene. LOC146439 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146439, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146439 BINDING SITE, designated SEQ ID:38151, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74590] Another function of VGAM2151 is therefore inhibition of LOC146439 (Accession XM_085463). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146439. LOC147895 (Accession XM_097339) is another VGAM2151 host target gene. LOC147895 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147895 BINDING SITE, designated SEQ ID:40861, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74591] Another function of VGAM2151 is therefore inhibition of LOC147895 (Accession XM_097339). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147895. LOC150113 (Accession XM_104532) is another VGAM2151 host target gene. LOC150113 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150113, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150113 BINDING SITE, designated SEQ ID:42168, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74592] Another function of VGAM2151 is therefore inhibition of LOC150113 (Accession XM_104532). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150113. LOC151610 (Accession XM_087245) is another VGAM2151 host target gene. LOC151610 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151610 BINDING SITE, designated SEQ ID:39136, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74593] Another function of VGAM2151 is therefore inhibition of LOC151610 (Accession XM_087245). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC151610. LOC152059 (Accession XM_087372) is another VGAM2151 host target gene. LOC152059 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152059 BINDING SITE, designated SEQ ID:39208, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74594] Another function of VGAM2151 is therefore inhibition of LOC152059 (Accession XM_087372). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152059. LOC158654 (Accession XM_088632) is another VGAM2151 host target gene. LOC158654 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158654 BINDING SITE, designated SEQ ID:39878, to the nucleotide sequence of VGAM2151 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4862.

[74595] Another function of VGAM2151 is therefore inhibition of LOC158654 (Accession XM_088632). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158654. LOC162022 (Accession XM_091293) is another VGAM2151 host target gene. LOC162022 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC162022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162022 BINDING SITE, designated SEQ ID:40044, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74596] Another function of VGAM2151 is therefore inhibition of LOC162022 (Accession XM_091293). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162022. LOC199796 (Accession XM_058994) is another VGAM2151 host target gene. LOC199796 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199796, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199796 BINDING SITE, designated SEQ ID:36813, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74597] Another function of VGAM2151 is therefore inhibition of LOC199796 (Accession XM_058994). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199796. LOC203069 (Accession XM_114618) is another VGAM2151 host target gene. LOC203069 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203069 BINDING SITE, designated SEQ ID:43001, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74598] Another function of VGAM2151 is therefore inhibition of LOC203069 (Accession XM_114618). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC203069. LOC221583 (Accession XM_166396) is another VGAM2151 host target gene. LOC221583 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221583, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221583 BINDING SITE, designated SEQ ID:44247, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74599] Another function of VGAM2151 is therefore inhibition of LOC221583 (Accession XM_166396). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221583. LOC254181 (Accession XM_174526) is another VGAM2151 host target gene. LOC254181 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254181 BINDING SITE, designated SEQ ID:46598, to

the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74600] Another function of VGAM2151 is therefore inhibition of LOC254181 (Accession XM_174526). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254181. LOC256586 (Accession XM_170759) is another VGAM2151 host target gene. LOC256586 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256586, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256586 BINDING SITE, designated SEQ ID:45514, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74601] Another function of VGAM2151 is therefore inhibition of LOC256586 (Accession XM_170759). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256586. LOC257438 (Accession XM_168338) is another VGAM2151 host target gene. LOC257438 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC257438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257438 BINDING SITE, designated SEQ ID:45108, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74602] Another function of VGAM2151 is therefore inhibition of LOC257438 (Accession XM_168338). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257438. LOC257612 (Accession XM_175270) is another VGAM2151 host target gene. LOC257612 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257612 BINDING SITE, designated SEQ ID:46742, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74603] Another function of VGAM2151 is therefore inhibition of LOC257612 (Accession XM_175270). Accordingly, utilities

of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257612. LOC51015 (Accession NM_016048) is another VGAM2151 host target gene. LOC51015 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51015 BINDING SITE, designated SEQ ID:18127, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74604] Another function of VGAM2151 is therefore inhibition of LOC51015 (Accession NM_016048). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51015. LOC57107 (Accession NM_020381) is another VGAM2151 host target gene. LOC57107 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC57107 BINDING SITE, designated SEQ ID:21651, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74605] Another function of VGAM2151 is therefore inhibition of LOC57107 (Accession NM_020381). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57107. LOC84548 (Accession XM_048904) is another VGAM2151 host target gene. LOC84548 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC84548, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84548 BINDING SITE, designated SEQ ID:35298, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74606] Another function of VGAM2151 is therefore inhibition of LOC84548 (Accession XM_048904). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84548. LOC90620 (Accession XM_032986) is another VGAM2151 host target gene. LOC90620 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90620 BINDING SITE, designated SEQ ID:31804, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74607] Another function of VGAM2151 is therefore inhibition of LOC90620 (Accession XM_032986). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90620. LOC90835 (Accession XM_034371) is another VGAM2151 host target gene. LOC90835 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90835, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90835 BINDING SITE, designated SEQ ID:32073, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74608] Another function of VGAM2151 is therefore inhibition of

LOC90835 (Accession XM_034371). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90835. LOC90874 (Accession XM_034660) is another VGAM2151 host target gene. LOC90874 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90874, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90874 BINDING SITE, designated SEQ ID:32135, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74609] Another function of VGAM2151 is therefore inhibition of LOC90874 (Accession XM_034660). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90874. LOC91156 (Accession XM_036558) is another VGAM2151 host target gene. LOC91156 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC91156 BINDING SITE, designated SEQ ID:32465, to the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, also designated SEQ ID:4862.

[74610] Another function of VGAM2151 is therefore inhibition of LOC91156 (Accession XM_036558). Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91156. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2152 (VGAM2152) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74611] VGAM2152 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2152 was detected is described hereinabove with reference to Figs. 1-8.

[74612] VGAM2152 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2152 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[74613] VGAM2152 gene encodes a VGAM2152 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2152 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2152 precursor RNA is designated SEQ ID:2138, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2138 is located at position 44423 relative to the genome of Rana Tigrina Ranavirus.

[74614] VGAM2152 precursor RNA folds onto itself, forming VGAM2152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74615] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2152 folded precursor RNA into VGAM2152 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2152 RNA is designated SEQ ID:4863, and is provided hereinbelow with reference to the sequence listing part.

[74616] VGAM2152 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2152 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2152 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74617] VGAM2152 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2152 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2152 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2152 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2152 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74618] The complementary binding of VGAM2152 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2152 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2152 host target RNA into VGAM2152 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74619] It is appreciated that VGAM2152 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2152 host target genes. The mRNA of each one of this plurality of VGAM2152 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2152 RNA, herein designated VGAM RNA, and which when bound by VGAM2152 RNA causes inhibition of translation of respective one or more VGAM2152 host target proteins.

[74620] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2152 gene, herein designated VGAM GENE, on one or more VGAM2152 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74621] It is yet further appreciated that a function of VGAM2152 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2152 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2152 correlate with, and may be deduced from, the identity of the host target genes which VGAM2152 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74622] Nucleotide sequences of the VGAM2152 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2152 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2152 are further described hereinbelow with reference to Table 1.

[74623] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2152 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2152 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74624] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2152 gene, herein designated VGAM is inhibition of expression of VGAM2152 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2152 correlate with, and may be deduced from, the identity of the target genes which VGAM2152 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74625] FLJ10748 (Accession NM_018203) is a VGAM2152 host target gene. FLJ10748 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10748 BINDING SITE, designated SEQ ID:20087, to the nucleotide sequence of VGAM2152 RNA, herein designated VGAM RNA, also designated SEQ ID:4863.

[74626] A function of VGAM2152 is therefore inhibition of FLJ10748 (Accession NM_018203). Accordingly, utilities of VGAM2152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10748. LOC112937 (Accession XM_166199) is another VGAM2152 host target gene. LOC112937 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC112937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112937 BINDING SITE, designated SEQ ID:44006, to the nucleotide sequence of VGAM2152 RNA, herein designated VGAM RNA, also designated SEQ ID:4863.

[74627] Another function of VGAM2152 is therefore inhibition of LOC112937 (Accession XM_166199). Accordingly, utilities of VGAM2152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112937. LOC158301 (Accession XM_088543) is another VGAM2152 host target gene. LOC158301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158301, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158301 BINDING SITE, designated SEQ ID:39811, to the nucleotide sequence of VGAM2152 RNA, herein designated VGAM RNA, also designated SEQ ID:4863.

[74628] Another function of VGAM2152 is therefore inhibition of LOC158301 (Accession XM_088543). Accordingly, utilities of VGAM2152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2153 (VGAM2153) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74629] VGAM2153 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2153 was detected is described hereinabove with reference to Figs. 1-8.

[74630] VGAM2153 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2153 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[74631] VGAM2153 gene encodes a VGAM2153 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2153 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2153 precursor RNA is designated SEQ ID:2139, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2139 is located at position 59440 relative to the genome of Rana Tigrina Ranavirus.

[74632] VGAM2153 precursor RNA folds onto itself, forming VGAM2153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74633] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2153 folded precursor RNA into VGAM2153

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2153 RNA is designated SEQ ID:4864, and is provided hereinbelow with reference to the sequence listing part.

[74634] VGAM2153 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2153 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2153 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74635] VGAM2153 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2153 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2153 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2153 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2153 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74636] The complementary binding of VGAM2153 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2153 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2153 host target RNA into VGAM2153 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[74637] It is appreciated that VGAM2153 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2153 host target genes. The mRNA of each one of this plurality of VGAM2153 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2153 RNA, herein designated VGAM RNA, and which when bound by VGAM2153 RNA causes inhibition of translation of respective one or more VGAM2153 host target proteins.

[74638] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2153 gene, herein designated VGAM GENE, on one or more VGAM2153 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74639] It is yet further appreciated that a function of VGAM2153 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2153 correlate with, and may be deduced from, the identity of the host target genes which VGAM2153 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74640] Nucleotide sequences of the VGAM2153 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2153 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2153 are further described hereinbelow with reference to Table 1.

[74641] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2153 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2153 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74642] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2153 gene, herein designated VGAM is inhibition of expression of VGAM2153 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2153 correlate with, and may be deduced from, the identity of the target genes which VGAM2153 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74643] Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 3 (CBFA2T3, Accession NM_005187) is a VGAM2153 host target gene. CBFA2T3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CBFA2T3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T3 BINDING SITE, designated SEQ ID:11692, to the nucleotide

sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74644] A function of VGAM2153 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 3 (CBFA2T3, Accession NM_005187). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T3. Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105) is another VGAM2153 host target gene. CLASP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CLASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLASP1 BINDING SITE, designated SEQ ID:32540, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74645] Another function of VGAM2153 is therefore inhibition of Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105), a gene which plays a role in the local regulation of microtubule dynamics . Accordingly, utilities of VGAM2153 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with CLASP1. The function of CLASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM298.Interleukin 13 Receptor, Alpha 1 (IL13RA1, Accession NM_001560) is another VGAM2153 host target gene. IL13RA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL13RA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL13RA1 BINDING SITE, designated SEQ ID:7284, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74646] Another function of VGAM2153 is therefore inhibition of Interleukin 13 Receptor, Alpha 1 (IL13RA1, Accession NM_001560), a gene which binds il-13 with a low affinity. together with il-4r- alpha can form a functional receptor for il-13. Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL13RA1. The function of IL13RA1 and its association with various diseases and

clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144.Inositol 1,4,5-triphosphate Receptor, Type 1 (ITPR1, Accession NM_002222) is another VGAM2153 host target gene. ITPR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR1 BINDING SITE, designated SEQ ID:7984, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74647] Another function of VGAM2153 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 1 (ITPR1, Accession NM_002222), a gene which couples cell membrane receptors to Ca2+ signal transduction pathways. Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR1. The function of ITPR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM106.Nijmegen Break-

age Syndrome 1 (nibrin) (NBS1, Accession XM_045343) is another VGAM2153 host target gene. NBS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBS1 BINDING SITE, designated SEQ ID:34435, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74648] Another function of VGAM2153 is therefore inhibition of Nijmegen Breakage Syndrome 1 (nibrin) (NBS1, Accession XM_045343), a gene which may be involved in repair of DNA double-strand breaks. Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBS1. The function of NBS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM450.NDRG Family Member 3 (NDRG3, Accession NM_032013) is another VGAM2153 host target gene. NDRG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

NDRG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG3 BINDING SITE, designated SEQ ID:25725, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74649] Another function of VGAM2153 is therefore inhibition of NDRG Family Member 3 (NDRG3, Accession NM_032013). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG3. Nuclear Receptor Subfamily 2, Group E, Member 3 (NR2E3, Accession NM_016346) is another VGAM2153 host target gene. NR2E3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NR2E3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR2E3 BINDING SITE, designated SEQ ID:18471, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74650] Another function of VGAM2153 is therefore inhibition of

Nuclear Receptor Subfamily 2, Group E, Member 3 (NR2E3, Accession NM_016346). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR2E3. RIG (Accession NM_006394) is another VGAM2153 host target gene. RIG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIG BINDING SITE, designated SEQ ID:13103, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74651] Another function of VGAM2153 is therefore inhibition of RIG (Accession NM_006394), a gene which is ribosomal protein S15. Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIG. The function of RIG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Solute Carrier Family 22 (extraneuronal monoamine transporter), Member 3 (SLC22A3, Accession NM_021977) is another

VGAM2153 host target gene. SLC22A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC22A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A3 BINDING SITE, designated SEQ ID:22507, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74652] Another function of VGAM2153 is therefore inhibition of Solute Carrier Family 22 (extraneuronal monoamine transporter), Member 3 (SLC22A3, Accession NM_021977), a gene which is a sodium-ion dependent, high affinity carnitine transporter. also transports organic cations without the involvement of sodium. involved in the active cellular uptake of carnitine. Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A3. The function of SLC22A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2147.WIG1 (Accession XM_170497) is another VGAM2153 host target gene. WIG1 BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by WIG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WIG1 BINDING SITE, designated SEQ ID:45336, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74653] Another function of VGAM2153 is therefore inhibition of WIG1 (Accession XM_170497), a gene which is a sensor of cellular stress conditions including oncogenic activation, DNA damage and hypoxia. Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WIG1. The function of WIG1 has been established by previous studies. 1. Hellborg, F.; Qian, W.; Mendez-Vidal, C.; Asker, C.; Kost-Alimova, M.; Wilhelm, M.; Imreh, S.; Wiman, K. G. : Human wig-1, a p53 target gene that encodes a growth inhibitory zinc finger protein. Oncogene 20: 5466-5474, 2001. PubMed ID : 11571644 2. Varmeh-Ziaie, S.; Okan, I.; Wang, Y.; Magnusson, K. P.; Warthoe, P.; Strauss, M.; Wiman, K. G. : Wig-1, a new p53-induced gene encoding a zinc finger protein. Oncogene 15: 2699-2704, 1997.

PubMed ID : 9400996

[74654] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[74655] Hellborg, F.; Qian, W.; Mendez-Vidal, C.; Asker, C.; Kost-Alimova, M.; Wilhelm, M.; Imreh, S.; Wiman, K. G. : Human wig-1, a p53 target gene that encodes a growth inhibitory zinc finger protein. Oncogene 20: 5466-5474, 2001. ; and

[74656] Varmeh-Ziaie, S.; Okan, I.; Wang, Y.; Magnusson, K. P.; Warthoe, P.; Strauss, M.; Wiman, K. G. : Wig-1, a new p53-induced gene encoding a zinc finger protein. Onco-gene 15: 2699-2704, 1.

[74657] Further studies establishing the function and utilities of WIG1 are found in John Hopkins OMIM database record ID 606452, and in sited publications numbered 6272-6273 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Zinc Finger Protein 202 (ZNF202, Accession NM_003455) is another VGAM2153 host target gene. ZNF202 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF202 BINDING SITE, designated SEQ ID:9509, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74658] Another function of VGAM2153 is therefore inhibition of Zinc Finger Protein 202 (ZNF202, Accession NM_003455). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF202. Chromosome 9 Open Reading Frame 5 (C9orf5, Accession NM_032012) is another VGAM2153 host target gene. C9orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf5 BINDING SITE, designated SEQ ID:25715, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74659] Another function of VGAM2153 is therefore inhibition of Chromosome 9 Open Reading Frame 5 (C9orf5, Accession NM_032012). Accordingly, utilities of VGAM2153 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf5. Chondrolectin (CHODL, Accession NM_024944) is another VGAM2153 host target gene. CHODL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHODL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHODL BINDING SITE, designated SEQ ID:24490, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74660] Another function of VGAM2153 is therefore inhibition of Chondrolectin (CHODL, Accession NM_024944). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHODL. CPR2 (Accession NM_030900) is another VGAM2153 host target gene. CPR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPR2 BIND-

ING SITE, designated SEQ ID:25173, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74661] Another function of VGAM2153 is therefore inhibition of CPR2 (Accession NM_030900). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPR2. DKFZP586M1120 (Accession NM_031294) is another VGAM2153 host target gene. DKFZP586M1120 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586M1120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586M1120 BINDING SITE, designated SEQ ID:25323, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74662] Another function of VGAM2153 is therefore inhibition of DKFZP586M1120 (Accession NM_031294). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M1120. DKFZp761K1423 (Accession

NM_018422) is another VGAM2153 host target gene. DKFZp761K1423 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp761K1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated SEQ ID:20470, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74663] Another function of VGAM2153 is therefore inhibition of DKFZp761K1423 (Accession NM_018422). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1423. DKFZp762E1312 (Accession NM_018410) is another VGAM2153 host target gene. DKFZp762E1312 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp762E1312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1312 BINDING SITE, designated SEQ ID:20451, to the nucleotide sequence of

VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74664] Another function of VGAM2153 is therefore inhibition of DKFZp762E1312 (Accession NM_018410). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1312. EZF-2 (Accession NM_018337) is another VGAM2153 host target gene. EZF-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EZF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EZF-2 BINDING SITE, designated SEQ ID:20341, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74665] Another function of VGAM2153 is therefore inhibition of EZF-2 (Accession NM_018337). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EZF-2. FLJ10520 (Accession NM_018124) is another VGAM2153 host target gene. FLJ10520 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by FLJ10520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10520 BINDING SITE, designated SEQ ID:19906, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74666] Another function of VGAM2153 is therefore inhibition of FLJ10520 (Accession NM_018124). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10520. FLJ13110 (Accession NM_022912) is another VGAM2153 host target gene. FLJ13110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13110 BINDING SITE, designated SEQ ID:23222, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74667] Another function of VGAM2153 is therefore inhibition of FLJ13110 (Accession NM_022912). Accordingly, utilities of

VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13110. FLJ13769 (Accession NM_025012) is another VGAM2153 host target gene. FLJ13769 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13769 BINDING SITE, designated SEQ ID:24596, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74668] Another function of VGAM2153 is therefore inhibition of FLJ13769 (Accession NM_025012). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13769. FLJ20081 (Accession NM_017658) is another VGAM2153 host target gene. FLJ20081 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20081

BINDING SITE, designated SEQ ID:19182, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74669] Another function of VGAM2153 is therefore inhibition of FLJ20081 (Accession NM_017658). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20081. FLJ20139 (Accession NM_017685) is another VGAM2153 host target gene. FLJ20139 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20139 BINDING SITE, designated SEQ ID:19234, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74670] Another function of VGAM2153 is therefore inhibition of FLJ20139 (Accession NM_017685). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20139. FLJ20477 (Accession NM_017837) is another VGAM2153 host target gene. FLJ20477 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20477 BINDING SITE, designated SEQ ID:19503, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74671] Another function of VGAM2153 is therefore inhibition of FLJ20477 (Accession NM_017837). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20477. FLJ21916 (Accession NM_023112) is another VGAM2153 host target gene. FLJ21916 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21916 BINDING SITE, designated SEQ ID:23381, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74672] Another function of VGAM2153 is therefore inhibition of

FLJ21916 (Accession NM_023112). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21916. FLJ23510 (Accession NM_024720) is another VGAM2153 host target gene. FLJ23510 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23510 BINDING SITE, designated SEQ ID:24053, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74673] Another function of VGAM2153 is therefore inhibition of FLJ23510 (Accession NM_024720). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23510. FLJ30294 (Accession NM_144632) is another VGAM2153 host target gene. FLJ30294 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ30294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ30294 BINDING SITE, designated SEQ ID:29451, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74674] Another function of VGAM2153 is therefore inhibition of FLJ30294 (Accession NM_144632). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30294. IKKE (Accession NM_014002) is another VGAM2153 host target gene. IKKE BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IKKE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IKKE BINDING SITE, designated SEQ ID:15204, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74675] Another function of VGAM2153 is therefore inhibition of IKKE (Accession NM_014002). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IKKE. KIAA0237 (Accession NM_014747) is another VGAM2153

host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16458, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74676] Another function of VGAM2153 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0337 (Accession NM_014786) is another VGAM2153 host target gene. KIAA0337 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0337 BINDING SITE, designated SEQ ID:16656, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74677] Another function of VGAM2153 is therefore inhibition of KIAA0337 (Accession NM_014786). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0337. KIAA0390 (Accession NM_014717) is another VGAM2153 host target gene. KIAA0390 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0390, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0390 BINDING SITE, designated SEQ ID:16271, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74678] Another function of VGAM2153 is therefore inhibition of KIAA0390 (Accession NM_014717). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0390. KIAA0451 (Accession NM_014826) is another VGAM2153 host target gene. KIAA0451 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0451, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0451 BINDING SITE, designated SEQ ID:16809, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74679] Another function of VGAM2153 is therefore inhibition of KIAA0451 (Accession NM_014826). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0451. KIAA0662 (Accession XM_088539) is another VGAM2153 host target gene. KIAA0662 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0662 BINDING SITE, designated SEQ ID:39804, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74680] Another function of VGAM2153 is therefore inhibition of KIAA0662 (Accession XM_088539). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0662. KIAA1318 (Accession XM_041080) is another VGAM2153 host target gene. KIAA1318 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1318 BINDING SITE, designated SEQ ID:33434, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74681] Another function of VGAM2153 is therefore inhibition of KIAA1318 (Accession XM_041080). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1318. KIAA1503 (Accession XM_043197) is another VGAM2153 host target gene. KIAA1503 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1503 BINDING SITE, designated SEQ ID:33917, to the nucleotide sequence of VGAM2153 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4864.

[74682] Another function of VGAM2153 is therefore inhibition of KIAA1503 (Accession XM_043197). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1503. KIAA1582 (Accession XM_037262) is another VGAM2153 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32580, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74683] Another function of VGAM2153 is therefore inhibition of KIAA1582 (Accession XM_037262). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. KIAA1817 (Accession XM_042978) is another VGAM2153 host target gene. KIAA1817 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1817, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1817 BINDING SITE, designated SEQ ID:33863, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74684] Another function of VGAM2153 is therefore inhibition of KIAA1817 (Accession XM_042978). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1817. MGC10765 (Accession NM_024345) is another VGAM2153 host target gene. MGC10765 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC10765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10765 BINDING SITE, designated SEQ ID:23645, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74685] Another function of VGAM2153 is therefore inhibition of MGC10765 (Accession NM_024345). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC10765. MGC13053 (Accession NM_032710) is another VGAM2153 host target gene. MGC13053 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC13053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13053 BINDING SITE, designated SEQ ID:26422, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74686] Another function of VGAM2153 is therefore inhibition of MGC13053 (Accession NM_032710). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13053. MGC13168 (Accession NM_032735) is another VGAM2153 host target gene. MGC13168 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC13168, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13168 BINDING SITE, designated SEQ ID:26460, to

the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74687] Another function of VGAM2153 is therefore inhibition of MGC13168 (Accession NM_032735). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13168. MGC2508 (Accession NM_024327) is another VGAM2153 host target gene. MGC2508 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2508 BINDING SITE, designated SEQ ID:23619, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74688] Another function of VGAM2153 is therefore inhibition of MGC2508 (Accession NM_024327). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2508. MGC2663 (Accession NM_024106) is another VGAM2153 host target gene. MGC2663 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by MGC2663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2663 BINDING SITE, designated SEQ ID:23550, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74689] Another function of VGAM2153 is therefore inhibition of MGC2663 (Accession NM_024106). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2663. PP1628 (Accession NM_025201) is another VGAM2153 host target gene. PP1628 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PP1628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1628 BINDING SITE, designated SEQ ID:24859, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74690] Another function of VGAM2153 is therefore inhibition of PP1628 (Accession NM_025201). Accordingly, utilities of

VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1628. Polyglutamine Binding Protein 1 (PQBP1, Accession NM_005710) is another VGAM2153 host target gene. PQBP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PQBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PQBP1 BINDING SITE, designated SEQ ID:12262, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74691] Another function of VGAM2153 is therefore inhibition of Polyglutamine Binding Protein 1 (PQBP1, Accession NM_005710). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PQBP1. RAB3-GAP150 (Accession NM_012414) is another VGAM2153 host target gene. RAB3-GAP150 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB3-GAP150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3-GAP150 BINDING SITE, designated SEQ ID:14790, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74692] Another function of VGAM2153 is therefore inhibition of RAB3-GAP150 (Accession NM_012414). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3-GAP150. Suppressor of Ty 4 Homolog 1 (S. cerevisiae) (SUPT4H1, Accession NM_003168) is another VGAM2153 host target gene. SUPT4H1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SUPT4H1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUPT4H1 BINDING SITE, designated SEQ ID:9145, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74693] Another function of VGAM2153 is therefore inhibition of Suppressor of Ty 4 Homolog 1 (S. cerevisiae) (SUPT4H1, Accession NM_003168). Accordingly, utilities of

VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUPT4H1. VILL (Accession XM_043435) is another VGAM2153 host target gene. VILL BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by VILL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VILL BINDING SITE, designated SEQ ID:33948, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74694] Another function of VGAM2153 is therefore inhibition of VILL (Accession XM_043435). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VILL. WSB1 (Accession NM_134264) is another VGAM2153 host target gene. WSB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WSB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WSB1 BINDING SITE, designated SEQ

ID:28619, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74695] Another function of VGAM2153 is therefore inhibition of WSB1 (Accession NM_134264). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WSB1. YKT6 (Accession NM_006555) is another VGAM2153 host target gene. YKT6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YKT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YKT6 BINDING SITE, designated SEQ ID:13322, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74696] Another function of VGAM2153 is therefore inhibition of YKT6 (Accession NM_006555). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YKT6. Zinc Finger Protein 271 (ZNF271, Accession XM_170865) is another VGAM2153 host target gene. ZNF271 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF271 BINDING SITE, designated SEQ ID:45636, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74697] Another function of VGAM2153 is therefore inhibition of Zinc Finger Protein 271 (ZNF271, Accession XM_170865). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF271. LOC126392 (Accession XM_065057) is another VGAM2153 host target gene. LOC126392 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC126392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126392 BINDING SITE, designated SEQ ID:37275, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74698] Another function of VGAM2153 is therefore inhibition of LOC126392 (Accession XM_065057). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126392. LOC144519 (Accession XM_084890) is another VGAM2153 host target gene. LOC144519 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144519 BINDING SITE, designated SEQ ID:37760, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74699] Another function of VGAM2153 is therefore inhibition of LOC144519 (Accession XM_084890). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144519. LOC145899 (Accession XM_096899) is another VGAM2153 host target gene. LOC145899 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145899, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145899 BINDING SITE, designated SEQ ID:40625, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74700] Another function of VGAM2153 is therefore inhibition of LOC145899 (Accession XM_096899). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145899. LOC146243 (Accession XM_096956) is another VGAM2153 host target gene. LOC146243 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146243 BINDING SITE, designated SEQ ID:40678, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74701] Another function of VGAM2153 is therefore inhibition of LOC146243 (Accession XM_096956). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146243. LOC146802 (Accession XM_085595) is another VGAM2153 host target gene. LOC146802 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146802, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146802 BINDING SITE, designated SEQ ID:38246, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74702] Another function of VGAM2153 is therefore inhibition of LOC146802 (Accession XM_085595). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146802. LOC147645 (Accession XM_085831) is another VGAM2153 host target gene. LOC147645 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147645, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147645 BINDING SITE, designated SEQ ID:38359, to the nucleotide sequence of VGAM2153 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4864.

[74703] Another function of VGAM2153 is therefore inhibition of LOC147645 (Accession XM_085831). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147645. LOC155038 (Accession XM_088130) is another VGAM2153 host target gene. LOC155038 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155038 BINDING SITE, designated SEQ ID:39533, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74704] Another function of VGAM2153 is therefore inhibition of LOC155038 (Accession XM_088130). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155038. LOC158117 (Accession XM_088483) is another VGAM2153 host target gene. LOC158117 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158117, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158117 BINDING SITE, designated SEQ ID:39728, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74705] Another function of VGAM2153 is therefore inhibition of LOC158117 (Accession XM_088483). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158117. LOC159199 (Accession XM_089441) is another VGAM2153 host target gene. LOC159199 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159199 BINDING SITE, designated SEQ ID:39982, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74706] Another function of VGAM2153 is therefore inhibition of LOC159199 (Accession XM_089441). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC159199. LOC161536 (Accession XM_090967) is another VGAM2153 host target gene. LOC161536 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC161536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161536 BINDING SITE, designated SEQ ID:40021, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74707] Another function of VGAM2153 is therefore inhibition of LOC161536 (Accession XM_090967). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161536. LOC201514 (Accession XM_113975) is another VGAM2153 host target gene. LOC201514 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201514 BINDING SITE, designated SEQ ID:42583, to

the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74708] Another function of VGAM2153 is therefore inhibition of LOC201514 (Accession XM_113975). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201514. LOC201707 (Accession XM_114369) is another VGAM2153 host target gene. LOC201707 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201707 BINDING SITE, designated SEQ ID:42903, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74709] Another function of VGAM2153 is therefore inhibition of LOC201707 (Accession XM_114369). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201707. LOC203275 (Accession XM_114667) is another VGAM2153 host target gene. LOC203275 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC203275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203275 BINDING SITE, designated SEQ ID:43025, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74710] Another function of VGAM2153 is therefore inhibition of LOC203275 (Accession XM_114667). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203275. LOC221583 (Accession XM_166396) is another VGAM2153 host target gene. LOC221583 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221583, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221583 BINDING SITE, designated SEQ ID:44244, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74711] Another function of VGAM2153 is therefore inhibition of LOC221583 (Accession XM_166396). Accordingly, utilities

of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221583. LOC253936 (Accession XM_170637) is another VGAM2153 host target gene. LOC253936 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253936 BINDING SITE, designated SEQ ID:45408, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74712] Another function of VGAM2153 is therefore inhibition of LOC253936 (Accession XM_170637). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253936. LOC255565 (Accession XM_170811) is another VGAM2153 host target gene. LOC255565 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC255565 BINDING SITE, designated SEQ ID:45587, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74713] Another function of VGAM2153 is therefore inhibition of LOC255565 (Accession XM_170811). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255565. LOC255974 (Accession XM_173706) is another VGAM2153 host target gene. LOC255974 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255974, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255974 BINDING SITE, designated SEQ ID:46557, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74714] Another function of VGAM2153 is therefore inhibition of LOC255974 (Accession XM_173706). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255974. LOC256021 (Accession XM_172884) is another VGAM2153 host target gene. LOC256021 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256021 BINDING SITE, designated SEQ ID:46167, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74715] Another function of VGAM2153 is therefore inhibition of LOC256021 (Accession XM_172884). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256021. LOC90010 (Accession XM_028150) is another VGAM2153 host target gene. LOC90010 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90010 BINDING SITE, designated SEQ ID:30620, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74716] Another function of VGAM2153 is therefore inhibition of

LOC90010 (Accession XM_028150). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90010. LOC90499 (Accession XM_032170) is another VGAM2153 host target gene. LOC90499 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90499 BINDING SITE, designated SEQ ID:31585, to the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, also designated SEQ ID:4864.

[74717] Another function of VGAM2153 is therefore inhibition of LOC90499 (Accession XM_032170). Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90499. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2154 (VGAM2154) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[74718] VGAM2154 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2154 was detected is described hereinabove with reference to Figs. 1-8.

[74719] VGAM2154 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2154 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74720] VGAM2154 gene encodes a VGAM2154 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2154 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2154 precursor RNA is designated SEQ ID:2140, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2140 is located at position 48817 relative to the genome of Rana Tigrina Ranavirus.

[74721] VGAM2154 precursor RNA folds onto itself, forming VGAM2154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74722] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2154 folded precursor RNA into VGAM2154 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2154 RNA is designated SEQ ID:4865, and is provided hereinbelow with reference to the sequence listing part.

[74723] VGAM2154 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2154 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2154 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74724] VGAM2154 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2154 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2154 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2154 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2154 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[74725] The complementary binding of VGAM2154 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2154 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2154 host target RNA into VGAM2154 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74726] It is appreciated that VGAM2154 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2154 host target genes. The mRNA of each one of this plurality of VGAM2154 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2154 RNA, herein designated VGAM RNA, and which when bound by VGAM2154 RNA causes inhibition of translation of respective one or more VGAM2154 host target proteins.

[74727] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2154 gene, herein designated VGAM GENE, on one

or more VGAM2154 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74728] It is yet further appreciated that a function of VGAM2154 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2154 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2154 correlate with, and may be deduced from, the identity of the host target genes which VGAM2154 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74729] Nucleotide sequences of the VGAM2154 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2154 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2154 are further described hereinbelow with reference to Table 1.

[74730] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2154 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2154 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74731] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2154 gene, herein designated VGAM is inhibition of expression of VGAM2154 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2154 correlate with, and may be deduced from, the identity of the target genes which VGAM2154 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74732] Tumor-associated Calcium Signal Transducer 2

(TACSTD2, Accession NM_002353) is a VGAM2154 host target gene. TACSTD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TACSTD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACSTD2 BINDING SITE, designated SEQ ID:8162, to the nucleotide sequence of VGAM2154 RNA, herein designated VGAM RNA, also designated SEQ ID:4865.

[74733] A function of VGAM2154 is therefore inhibition of Tumor-associated Calcium Signal Transducer 2 (TACSTD2, Accession NM_002353), a gene which belongs to ga733 tumor-associated antigen gene family and may function as growth factor receptors. Accordingly, utilities of VGAM2154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACSTD2. The function of TACSTD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210.E74-like Factor 1 (ets domain transcription factor) (ELF1, Accession XM_049376) is another VGAM2154 host target gene. ELF1 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELF1 BINDING SITE, designated SEQ ID:35401, to the nucleotide sequence of VGAM2154 RNA, herein designated VGAM RNA, also designated SEQ ID:4865.

[74734] Another function of VGAM2154 is therefore inhibition of E74-like Factor 1 (ets domain transcription factor) (ELF1, Accession XM_049376). Accordingly, utilities of VGAM2154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELF1. MGC16202 (Accession NM_032373) is another VGAM2154 host target gene. MGC16202 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC16202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16202 BINDING SITE, designated SEQ ID:26161, to the nucleotide sequence of VGAM2154 RNA, herein designated VGAM RNA, also designated SEQ ID:4865.

[74735] Another function of VGAM2154 is therefore inhibition of MGC16202 (Accession NM_032373). Accordingly, utilities of VGAM2154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16202. LOC147219 (Accession XM_097214) is another VGAM2154 host target gene. LOC147219 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147219 BINDING SITE, designated SEQ ID:40824, to the nucleotide sequence of VGAM2154 RNA, herein designated VGAM RNA, also designated SEQ ID:4865.

[74736] Another function of VGAM2154 is therefore inhibition of LOC147219 (Accession XM_097214). Accordingly, utilities of VGAM2154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147219. LOC153114 (Accession XM_098313) is another VGAM2154 host target gene. LOC153114 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153114, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153114 BINDING SITE, designated SEQ ID:41574, to the nucleotide sequence of VGAM2154 RNA, herein designated VGAM RNA, also designated SEQ ID:4865.

[74737] Another function of VGAM2154 is therefore inhibition of LOC153114 (Accession XM_098313). Accordingly, utilities of VGAM2154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153114. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2155 (VGAM2155) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74738] VGAM2155 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2155 was detected is described hereinabove with reference to Figs. 1-8.

[74739] VGAM2155 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2155 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[74740] VGAM2155 gene encodes a VGAM2155 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2155 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2155 precursor RNA is designated SEQ ID:2141, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2141 is located at position 168488 relative to the genome of Monkeypox Virus.

[74741] VGAM2155 precursor RNA folds onto itself, forming VGAM2155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74742] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2155 folded precursor RNA into VGAM2155

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2155 RNA is designated SEQ ID:4866, and is provided hereinbelow with reference to the sequence listing part.

[74743] VGAM2155 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2155 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2155 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74744] VGAM2155 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2155 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2155 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2155 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2155 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74745] The complementary binding of VGAM2155 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2155 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2155 host target RNA into VGAM2155 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[74746] It is appreciated that VGAM2155 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2155 host target genes. The mRNA of each one of this plurality of VGAM2155 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2155 RNA, herein designated VGAM RNA, and which when bound by VGAM2155 RNA causes inhibition of translation of respective one or more VGAM2155 host target proteins.

[74747] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2155 gene, herein designated VGAM GENE, on one or more VGAM2155 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74748] It is yet further appreciated that a function of VGAM2155 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2155 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2155 correlate with, and may be deduced from, the identity of the host target genes which VGAM2155 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74749] Nucleotide sequences of the VGAM2155 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2155 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2155 are further described hereinbelow with reference to Table 1.

[74750] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2155 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2155 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74751] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2155 gene, herein designated VGAM is inhibition of expression of VGAM2155 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2155 correlate with, and may be deduced from, the identity of the target genes which VGAM2155 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74752] Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM_000141) is a VGAM2155 host target gene. FGFR2 BINDING SITE1 through FGFR2 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of FGFR2 BINDING SITE1 through FGFR2 BINDING SITE6, designated SEQ ID:5641, SEQ ID:23237, SEQ ID:23244, SEQ ID:23291, SEQ ID:23297 and SEQ ID:23303 respectively, to the nucleotide sequence of VGAM2155 RNA, herein designated VGAM RNA, also designated SEQ ID:4866.

[74753] A function of VGAM2155 is therefore inhibition of Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM_000141). Accordingly, utilities of VGAM2155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR2. Potassium Inwardly-rectifying Channel, Subfamily J, Member 6 (KCNJ6, Accession NM_002240) is another VGAM2155 host target gene. KCNJ6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNJ6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ6 BINDING SITE, designated SEQ ID:8023, to the nucleotide se-

quence of VGAM2155 RNA, herein designated VGAM RNA, also designated SEQ ID:4866.

[74754] Another function of VGAM2155 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 6 (KCNJ6, Accession NM_002240), a gene which may be involved in the regulation of insulin secretion by glucose and/or neurotransmitters. Accordingly, utilities of VGAM2155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ6. The function of KCNJ6 has been established by previous studies. ATP-sensitive potassium channels, also called K(ATP) channels, are closed by an increase in the intracellular ATP concentration of the cell and thereby provide a means of linking cellular metabolism to the electrical excitability of the plasma membrane. Sakura et al. (1995) stated that their physiologic function is best understood in the pancreatic beta-cell where they play a key role in the regulation of insulin secretion in response to nutrients. Closure of K(ATP) channels, as the result of metabolically generated ATP, produces membrane depolarization. This leads to activation of voltage-sensitive Ca(2+) channels, Ca(2+) influx, and ultimately insulin release. Sakura et al. (1995) cloned the KCNJ6 gene, which

encodes a putative subunit of a human ATP-sensitive K-channel expressed in brain and beta cells, and characterized its exon/intron structure. By screening of a somatic cell mapping panel and fluorescence in situ hybridization, they placed the gene on 21q22.1-q22.2. Analysis of SSCPs revealed the presence of 2 silent polymorphisms (pro149: CCG-CCA and asp328: GAC-GAT) with similar frequencies in normal and noninsulin-dependent diabetic patients. The weaver mutation, discovered by Lane (1964), had been studied intensively for more than 25 years (Rakic and Sidman, 1973) for insights into the normal processes of neural development and differentiation. Homozygous animals suffer from severe ataxia that is obvious by about the second postnatal week. The cerebellum of these animals is drastically reduced in size due to depletion of the major cell type of cerebellum, the granule cell neuron. Heterozygous animals are not ataxic but have an intermediate number of surviving granule cells. Patil et al. (1995), and other workers before them, found that the overall expression pattern of the Girk2 gene corresponds closely to the pattern of phenotypic effects in weaver mice. Expression in the cerebellum, substantia nigra, and testes is associated with a developmental loss of cells in

those tissues. Expression of Girk2 in the cortex is consistent with seizures that affect weaver mice. Goldowitz and Smeyne (1995) diagrammed the developmental events in the early postnatal cerebellum in wildtype and weaver mice, the expression pattern of Girk2 mRNA in adult brain, and the proposed role of Girk2 in normal and abnormal granule cell differentiation.

[74755] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[74756] Bandmann, O.; Davis, M. B.; Marsden, C. D.; Wood, N. W. : The human homologue of the Weaver mouse gene in familial and sporadic Parkinson's disease. Neuroscience 72: 877-879, 1996. ; and

[74757] Goldowitz, D.; Smeyne, R. J. : Tune into the weaver channel. Nature Genet. 11: 107-109, 1995.

[74758] Further studies establishing the function and utilities of KCNJ6 are found in John Hopkins OMIM database record ID 600877, and in sited publications numbered 3274, 6844-684 and 10066-6851 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ14075 (Accession NM_024894) is another VGAM2155 host target gene. FLJ14075 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14075 BINDING SITE, designated SEQ ID:24373, to the nucleotide sequence of VGAM2155 RNA, herein designated VGAM RNA, also designated SEQ ID:4866.

[74759] Another function of VGAM2155 is therefore inhibition of FLJ14075 (Accession NM_024894). Accordingly, utilities of VGAM2155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14075. KIAA0626 (Accession NM_021647) is another VGAM2155 host target gene. KIAA0626 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0626, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0626 BINDING SITE, designated SEQ ID:22314, to the nucleotide sequence of VGAM2155 RNA, herein designated VGAM RNA, also designated SEQ ID:4866.

[74760] Another function of VGAM2155 is therefore inhibition of

KIAA0626 (Accession NM_021647). Accordingly, utilities of VGAM2155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0626. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2156 (VGAM2156) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74761] VGAM2156 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2156 was detected is described hereinabove with reference to Figs. 1-8.

[74762] VGAM2156 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2156 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74763] VGAM2156 gene encodes a VGAM2156 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2156 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2156 precursor RNA is designated SEQ ID:2142, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2142 is located at position 170622 relative to the genome of Monkeypox Virus.

[74764] VGAM2156 precursor RNA folds onto itself, forming VGAM2156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74765] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2156 folded precursor RNA into VGAM2156 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide se-

quence of VGAM2156 RNA is designated SEQ ID:4867, and is provided hereinbelow with reference to the sequence listing part.

[74766] VGAM2156 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2156 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2156 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74767] VGAM2156 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2156 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2156 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2156 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2156 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74768] The complementary binding of VGAM2156 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2156 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2156 host target RNA into VGAM2156 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74769] It is appreciated that VGAM2156 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2156 host target genes. The mRNA of each one of this plurality of VGAM2156 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2156 RNA, herein designated VGAM RNA, and which when bound by VGAM2156 RNA causes inhibition of translation of respective one or more VGAM2156 host target proteins.

[74770] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2156 gene, herein designated VGAM GENE, on one or more VGAM2156 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74771] It is yet further appreciated that a function of VGAM2156

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2156 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2156 correlate with, and may be deduced from, the identity of the host target genes which VGAM2156 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74772] Nucleotide sequences of the VGAM2156 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2156 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2156 are further described hereinbelow with reference to Table 1.

[74773] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2156 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2156 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74774] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2156 gene, herein designated VGAM is inhibition of expression of VGAM2156 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2156 correlate with, and may be deduced from, the identity of the target genes which VGAM2156 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74775] FLJ22283 (Accession NM_032220) is a VGAM2156 host target gene. FLJ22283 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22283 BINDING SITE, designated SEQ ID:25947, to the nucleotide sequence of VGAM2156 RNA, herein designated VGAM RNA, also designated SEQ ID:4867.

[74776] A function of VGAM2156 is therefore inhibition of FLJ22283 (Accession NM_032220). Accordingly, utilities of VGAM2156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22283. LOC219686 (Accession XM_165544) is another

VGAM2156 host target gene. LOC219686 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219686 BINDING SITE, designated SEQ ID:43676, to the nucleotide sequence of VGAM2156 RNA, herein designated VGAM RNA, also designated SEQ ID:4867.

[74777] Another function of VGAM2156 is therefore inhibition of LOC219686 (Accession XM_165544). Accordingly, utilities of VGAM2156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219686. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2157 (VGAM2157) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74778] VGAM2157 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2157 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[74779] VGAM2157 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2157 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74780] VGAM2157 gene encodes a VGAM2157 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2157 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2157 precursor RNA is designated SEQ ID:2143, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2143 is located at position 162621 relative to the genome of Monkeypox Virus.

[74781] VGAM2157 precursor RNA folds onto itself, forming VGAM2157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74782] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2157 folded precursor RNA into VGAM2157 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2157 RNA is designated SEQ ID:4868, and is provided hereinbelow with reference to the sequence listing part.

[74783] VGAM2157 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2157 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2157 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74784] VGAM2157 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2157 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2157 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2157 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2157 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74785] The complementary binding of VGAM2157 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2157 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2157 host target RNA into VGAM2157 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74786] It is appreciated that VGAM2157 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2157 host target genes. The mRNA of each one of this plurality of VGAM2157 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2157 RNA, herein designated VGAM RNA, and which when bound by VGAM2157 RNA causes inhibition of translation of respective one or more VGAM2157 host target proteins.

[74787] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2157 gene, herein designated VGAM GENE, on one or more VGAM2157 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74788] It is yet further appreciated that a function of VGAM2157 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2157 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2157 correlate with, and may be deduced from, the identity of the host target genes which VGAM2157 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74789] Nucleotide sequences of the VGAM2157 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2157 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2157 are further described hereinbelow with reference to Table 1.

[74790] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2157 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2157 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74791] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2157 gene, herein designated VGAM is inhibition of expression of VGAM2157 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2157 correlate with, and may be deduced from, the identity of the target genes which VGAM2157 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74792] Ficolin (collagen/fibrinogen domain containing lectin) 2 (hucolin) (FCN2, Accession NM_015838) is a VGAM2157 host target gene. FCN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FCN2, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCN2 BINDING SITE, designated SEQ ID:17950, to the nucleotide sequence of VGAM2157 RNA, herein designated VGAM RNA, also designated SEQ ID:4868.

[74793] A function of VGAM2157 is therefore inhibition of Ficolin (collagen/fibrinogen domain containing lectin) 2 (hucolin) (FCN2, Accession NM_015838), a gene which is involved in phagocytosis of pathogens. Accordingly, utilities of VGAM2157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCN2. The function of FCN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM493.LOC90148 (Accession XM_029430) is another VGAM2157 host target gene. LOC90148 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90148, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90148 BINDING SITE, designated SEQ ID:30890, to the

nucleotide sequence of VGAM2157 RNA, herein designated VGAM RNA, also designated SEQ ID:4868.

[74794] Another function of VGAM2157 is therefore inhibition of LOC90148 (Accession XM_029430). Accordingly, utilities of VGAM2157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90148. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2158 (VGAM2158) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74795] VGAM2158 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2158 was detected is described hereinabove with reference to Figs. 1-8.

[74796] VGAM2158 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2158 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74797] VGAM2158 gene encodes a VGAM2158 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2158 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2158 precursor RNA is designated SEQ ID:2144, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2144 is located at position 165985 relative to the genome of Monkeypox Virus.

[74798] VGAM2158 precursor RNA folds onto itself, forming VGAM2158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74799] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2158 folded precursor RNA into VGAM2158 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2158 RNA is designated SEQ ID:4869, and is provided hereinbelow with reference to the sequence listing part.

[74800] VGAM2158 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2158 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2158 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74801] VGAM2158 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2158 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2158 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2158 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2158 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74802] The complementary binding of VGAM2158 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2158 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2158 host target RNA into VGAM2158 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74803] It is appreciated that VGAM2158 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2158 host target genes. The mRNA of each one of this plurality of VGAM2158 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2158 RNA, herein designated VGAM RNA, and which when bound by VGAM2158 RNA causes inhibition of translation of respective one or more VGAM2158 host target proteins.

[74804] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2158 gene, herein designated VGAM GENE, on one or more VGAM2158 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74805] It is yet further appreciated that a function of VGAM2158 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2158 correlate with, and may be deduced from, the identity of the host target genes which VGAM2158 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74806] Nucleotide sequences of the VGAM2158 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2158 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2158 are further described hereinbelow with reference to Table 1.

[74807] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2158 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2158 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74808] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2158 gene, herein designated VGAM is inhibition of expression of VGAM2158 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2158 correlate with, and may be deduced from, the identity of the target genes which VGAM2158 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74809] Dopachrome Tautomerase (dopachrome delta-isomerase, tyrosine-related protein 2) (DCT, Accession NM_001922) is a VGAM2158 host target gene. DCT BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DCT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCT BINDING SITE, designated SEQ ID:7638, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74810] A function of VGAM2158 is therefore inhibition of

Dopachrome Tautomerase (dopachrome delta-isomerase, tyrosine-related protein 2) (DCT, Accession NM_001922), a gene which regulates eumelanin and phaeomelanin levels. Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCT. The function of DCT has been established by previous studies. Sturm et al. (1995) showed that the TYRP1 protein is encoded in 7 exons spread over 24 kb of genomic DNA. By contrast, the TYRP2 protein is encoded by 8 exons. TYRP1, TYRP2, and the tyrosinase gene share a common C-terminal membrane spanning exon. The position of intron junctions suggested that TYRP1 was derived from a TYR duplication and then was itself duplicated to give rise to the TYRP2 gene. The comparisons also suggested that at least some of the introns within the TYR, TYRP1, and TYRP2 coding regions were gained after duplication and that intron slippage was unlikely to have occurred. NYESO1 (CTAG; 300156) is expressed on tumor cells of many different types, including melanoma. TRP2 is a melanoma-differentiation antigen. In a melanoma vaccine trial in patients with metastatic disease, Khong and Rosenberg (2002) identified tumor-infiltrating lymphocytes (TILs)

that recognized NYESO1, TRP2, and a TRP2 splice variant from a patient who experienced dramatic tumor regression. The TILs expressed immunologic reactivity against these antigens before vaccination with antigens, none of which she had been vaccinated against. Khong and Rosenberg (2002) proposed that NYESO1 and TRP2 may be useful in the active immunotherapy of patients with melanoma.

[74811] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[74812] Khong, H. T.; Rosenberg, S. A. : Pre-existing immunity to tyrosinase-related protein (TRP)-2, a new TRP-2 isoform, and the NY-ESO-1 melanoma antigen in a patient with a dramatic response to immunotherapy. J. Immun. 168: 951-956, 2002. ; and

[74813] Sturm, R. A.; O'Sullivan B. J.; Box, N. F.; Smith, A. G.; Smit, S. E.; Puttick, E. R. J.; Parsons, P. G.; Dunn, I. S. : Chromosomal structure of the human TYRP1 and TYRP2 loci and compa.

[74814] Further studies establishing the function and utilities of DCT are found in John Hopkins OMIM database record ID 191275, and in sited publications numbered 2559-2566

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838) is another VGAM2158 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41876, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74815] Another function of VGAM2158 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Hypoxia-inducible Factor 1, Alpha Subunit (basic helix-loop-helix transcription factor) (HIF1A, Accession NM_001530) is another VGAM2158 host target gene. HIF1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIF1A BINDING SITE, designated SEQ ID:7267, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74816] Another function of VGAM2158 is therefore inhibition of Hypoxia-inducible Factor 1, Alpha Subunit (basic helix-loop-helix transcription factor) (HIF1A, Accession NM_001530), a gene which is a basic helix-loop-helix transcription factor and mediates transcriptional responses to hypoxia and dioxin-signaling. Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIF1A. The function of HIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229.Potassium Large Conductance Calcium-activated Channel, Subfamily M Beta Member 3 (KCNMB3, Accession NM_014407) is another VGAM2158 host target gene. KCNMB3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNMB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNMB3 BINDING SITE, designated SEQ ID:15749, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74817] Another function of VGAM2158 is therefore inhibition of Potassium Large Conductance Calcium-activated Channel, Subfamily M Beta Member 3 (KCNMB3, Accession NM_014407), a gene which is similar to a regulatory subunit of Ca-activated potassium channel. Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNMB3. The function of KCNMB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111.Membrane Component, Chromosome 17, Surface Marker 2 (ovarian carcinoma antigen CA125) (M17S2, Accession NM_031858) is another VGAM2158 host target gene. M17S2 BINDING SITE1 through M17S2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by M17S2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of M17S2 BINDING SITE1 through M17S2 BINDING SITE3, designated SEQ ID:25609, SEQ ID:25622 and SEQ ID:12520 respectively, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74818] Another function of VGAM2158 is therefore inhibition of Membrane Component, Chromosome 17, Surface Marker 2 (ovarian carcinoma antigen CA125) (M17S2, Accession NM_031858), a gene which Contains a B-box/coiled coil motif. Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M17S2. The function of M17S2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1081.Tumor Necrosis Factor Receptor Superfamily, Member 9 (TNFRSF9, Accession NM_001561) is another VGAM2158 host target gene. TNFRSF9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFRSF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of TNFRSF9 BINDING SITE, designated SEQ ID:7288, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74819] Another function of VGAM2158 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 9 (TNFRSF9, Accession NM_001561), a gene which inhibits proliferation of activated T lymphocytes. Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF9. The function of TNFRSF9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1954.Chromosome 13 Open Reading Frame 1 (C13orf1, Accession NM_020456) is another VGAM2158 host target gene. C13orf1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C13orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C13orf1 BINDING SITE, designated SEQ ID:21693, to the nucleotide sequence of VGAM2158 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4869.

[74820] Another function of VGAM2158 is therefore inhibition of Chromosome 13 Open Reading Frame 1 (C13orf1, Accession NM_020456). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C13orf1. C3IP1 (Accession NM_021633) is another VGAM2158 host target gene. C3IP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C3IP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C3IP1 BINDING SITE, designated SEQ ID:22275, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74821] Another function of VGAM2158 is therefore inhibition of C3IP1 (Accession NM_021633). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3IP1. Chromosome 5 Open Reading Frame 5 (C5orf5, Accession NM_016603) is another VGAM2158 host target gene. C5orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

C5orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf5 BINDING SITE, designated SEQ ID:18699, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74822] Another function of VGAM2158 is therefore inhibition of Chromosome 5 Open Reading Frame 5 (C5orf5, Accession NM_016603). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf5. Histidine Triad Nucleotide Binding Protein 3 (HINT3, Accession NM_138571) is another VGAM2158 host target gene. HINT3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HINT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HINT3 BINDING SITE, designated SEQ ID:28878, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74823] Another function of VGAM2158 is therefore inhibition of

Histidine Triad Nucleotide Binding Protein 3 (HINT3, Accession NM_138571). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HINT3. KIAA0416 (Accession NM_015564) is another VGAM2158 host target gene. KIAA0416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0416 BINDING SITE, designated SEQ ID:17837, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74824] Another function of VGAM2158 is therefore inhibition of KIAA0416 (Accession NM_015564). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0416. KIAA0781 (Accession XM_041314) is another VGAM2158 host target gene. KIAA0781 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0781, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0781 BINDING SITE, designated SEQ ID:33499, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74825] Another function of VGAM2158 is therefore inhibition of KIAA0781 (Accession XM_041314). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0781. KIAA0871 (Accession NM_014961) is another VGAM2158 host target gene. KIAA0871 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0871 BINDING SITE, designated SEQ ID:17332, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74826] Another function of VGAM2158 is therefore inhibition of KIAA0871 (Accession NM_014961). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0871. KIAA1505 (Accession XM_168469) is another VGAM2158 host target gene. KIAA1505 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1505 BINDING SITE, designated SEQ ID:45190, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74827] Another function of VGAM2158 is therefore inhibition of KIAA1505 (Accession XM_168469). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1505. KIAA1678 (Accession XM_051221) is another VGAM2158 host target gene. KIAA1678 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1678 BINDING SITE, designated SEQ ID:35787, to the nucleotide sequence of VGAM2158 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4869.

[74828] Another function of VGAM2158 is therefore inhibition of KIAA1678 (Accession XM_051221). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1678. MGC16063 (Accession NM_053047) is another VGAM2158 host target gene. MGC16063 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC16063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16063 BINDING SITE, designated SEQ ID:27590, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74829] Another function of VGAM2158 is therefore inhibition of MGC16063 (Accession NM_053047). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16063. MSTP031 (Accession NM_032035) is another VGAM2158 host target gene. MSTP031 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MSTP031, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP031 BINDING SITE, designated SEQ ID:25734, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74830] Another function of VGAM2158 is therefore inhibition of MSTP031 (Accession NM_032035). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP031. Neuron Navigator 3 (NAV3, Accession NM_014903) is another VGAM2158 host target gene. NAV3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NAV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAV3 BINDING SITE, designated SEQ ID:17088, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74831] Another function of VGAM2158 is therefore inhibition of Neuron Navigator 3 (NAV3, Accession NM_014903). Accordingly, utilities of VGAM2158 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with NAV3. LOC51212 (Accession NM_016380) is another VGAM2158 host target gene. LOC51212 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51212 BINDING SITE, designated SEQ ID:18518, to the nucleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, also designated SEQ ID:4869.

[74832] Another function of VGAM2158 is therefore inhibition of LOC51212 (Accession NM_016380). Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51212. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2159 (VGAM2159) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74833] VGAM2159 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2159 was detected is described hereinabove with reference to Figs. 1-8.

[74834] VGAM2159 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2159 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74835] VGAM2159 gene encodes a VGAM2159 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2159 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2159 precursor RNA is designated SEQ ID:2145, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2145 is located at position 155355 relative to the genome of Monkeypox Virus.

[74836] VGAM2159 precursor RNA folds onto itself, forming VGAM2159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74837] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2159 folded precursor RNA into VGAM2159 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2159 RNA is designated SEQ ID:4870, and is provided hereinbelow with reference to the sequence listing part.

[74838] VGAM2159 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2159 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2159 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74839] VGAM2159 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2159 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2159 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2159 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2159 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74840] The complementary binding of VGAM2159 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2159 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2159 host target RNA into VGAM2159 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74841] It is appreciated that VGAM2159 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2159 host target genes. The mRNA of each one of this plurality of VGAM2159 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2159 RNA, herein designated VGAM RNA, and which when bound by VGAM2159 RNA causes inhibition of translation of respective one or more VGAM2159 host target proteins.

[74842] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2159 gene, herein designated VGAM GENE, on one or more VGAM2159 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74843] It is yet further appreciated that a function of VGAM2159 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2159 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2159 correlate with, and may be deduced from, the identity of the host target genes which VGAM2159 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74844] Nucleotide sequences of the VGAM2159 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2159 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2159 are further described hereinbelow with reference to Table 1.

[74845] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2159 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2159 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74846] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2159 gene, herein designated VGAM is inhibition of expression of VGAM2159 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2159 correlate with, and may be deduced from, the identity of the target genes which VGAM2159 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74847] Espin (ESPN, Accession NM_031475) is a VGAM2159 host target gene. ESPN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by ESPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESPN BINDING SITE, designated SEQ ID:25548, to the nucleotide sequence of VGAM2159 RNA, herein designated VGAM RNA, also designated SEQ ID:4870.

[74848] A function of VGAM2159 is therefore inhibition of Espin (ESPN, Accession NM_031475), a gene which a membrane-cytoskeletal assemblages . Accordingly, utilities of VGAM2159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESPN. The function of ESPN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1006.Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM_085943) is another VGAM2159 host target gene. GRLF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRLF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, des-

ignated SEQ ID:38407, to the nucleotide sequence of VGAM2159 RNA, herein designated VGAM RNA, also designated SEQ ID:4870.

[74849] Another function of VGAM2159 is therefore inhibition of Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM_085943), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of VGAM2159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRLF1. The function of GRLF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Integrin, Alpha 2 (CD49B, alpha 2 subunit of VLA-2 receptor) (ITGA2, Accession NM_002203) is another VGAM2159 host target gene. ITGA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA2 BINDING SITE, designated SEQ ID:7962, to the nucleotide sequence of VGAM2159 RNA, herein designated VGAM RNA, also designated SEQ ID:4870.

[74850] Another function of VGAM2159 is therefore inhibition of Integrin, Alpha 2 (CD49B, alpha 2 subunit of VLA-2 receptor) (ITGA2, Accession NM_002203), a gene which has roles in blood clotting and angiogenesis, acts as a collagen and laminin receptor. Accordingly, utilities of VGAM2159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA2. The function of ITGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827.Wilms Tumor 1 (WT1, Accession NM_024424) is another VGAM2159 host target gene. WT1 BINDING SITE1 through WT1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WT1 BINDING SITE1 through WT1 BINDING SITE4, designated SEQ ID:23667, SEQ ID:23675, SEQ ID:23671 and SEQ ID:5951 respectively, to the nucleotide sequence of VGAM2159 RNA, herein designated VGAM RNA, also designated SEQ ID:4870.

[74851] Another function of VGAM2159 is therefore inhibition of

Wilms Tumor 1 (WT1, Accession NM_024424). Accordingly, utilities of VGAM2159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WT1. KIAA0993 (Accession XM_034413) is another VGAM2159 host target gene. KIAA0993 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0993 BINDING SITE, designated SEQ ID:32083, to the nucleotide sequence of VGAM2159 RNA, herein designated VGAM RNA, also designated SEQ ID:4870.

[74852] Another function of VGAM2159 is therefore inhibition of KIAA0993 (Accession XM_034413). Accordingly, utilities of VGAM2159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0993. KIAA1416 (Accession XM_098762) is another VGAM2159 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41797, to the nucleotide sequence of VGAM2159 RNA, herein designated VGAM RNA, also designated SEQ ID:4870.

[74853] Another function of VGAM2159 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM2159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. My015 (Accession XM_039512) is another VGAM2159 host target gene. My015 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by My015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of My015 BINDING SITE, designated SEQ ID:33103, to the nucleotide sequence of VGAM2159 RNA, herein designated VGAM RNA, also designated SEQ ID:4870.

[74854] Another function of VGAM2159 is therefore inhibition of My015 (Accession XM_039512). Accordingly, utilities of VGAM2159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with My015. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2,

Accession NM_014737) is another VGAM2159 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:16388, to the nucleotide sequence of VGAM2159 RNA, herein designated VGAM RNA, also designated SEQ ID:4870.

[74855] Another function of VGAM2159 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737). Accordingly, utilities of VGAM2159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession XM_053740) is another VGAM2159 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:36112 and SEQ ID:27101 respectively, to the nucleotide sequence of VGAM2159 RNA, herein designated VGAM RNA, also designated SEQ ID:4870.

[74856] Another function of VGAM2159 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession XM_053740). Accordingly, utilities of VGAM2159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1. LOC157503 (Accession XM_098767) is another VGAM2159 host target gene. LOC157503 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157503 BINDING SITE, designated SEQ ID:41815, to the nucleotide sequence of VGAM2159 RNA, herein designated VGAM RNA, also designated SEQ ID:4870.

[74857] Another function of VGAM2159 is therefore inhibition of LOC157503 (Accession XM_098767). Accordingly, utilities of VGAM2159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157503. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2160 (VGAM2160) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74858] VGAM2160 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2160 was detected is described hereinabove with reference to Figs. 1-8.

[74859] VGAM2160 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2160 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74860] VGAM2160 gene encodes a VGAM2160 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2160 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2160 precursor RNA is designated SEQ ID:2146, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2146 is located at position 168205 relative to the genome of Monkeypox Virus.

[74861] VGAM2160 precursor RNA folds onto itself, forming VGAM2160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74862] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2160 folded precursor RNA into VGAM2160 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2160 RNA is designated SEQ ID:4871, and is provided hereinbelow with reference to the sequence listing part.

[74863] VGAM2160 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2160 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2160 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74864] VGAM2160 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2160 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2160 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2160 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2160 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74865] The complementary binding of VGAM2160 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2160 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2160 host target RNA into VGAM2160 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74866] It is appreciated that VGAM2160 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2160 host target genes. The mRNA of each one of this plurality of VGAM2160 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2160 RNA, herein designated VGAM RNA, and which when bound by VGAM2160 RNA causes

inhibition of translation of respective one or more VGAM2160 host target proteins.

[74867] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2160 gene, herein designated VGAM GENE, on one or more VGAM2160 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74868] It is yet further appreciated that a function of VGAM2160 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2160 include diagnosis, prevention and

treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2160 correlate with, and may be deduced from, the identity of the host target genes which VGAM2160 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74869] Nucleotide sequences of the VGAM2160 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2160 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2160 are further described hereinbelow with reference to Table 1.

[74870] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2160 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2160 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74871] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2160 gene, herein designated VGAM is inhibition of expression of VGAM2160 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2160 correlate with, and may be deduced from, the identity of the target genes which VGAM2160 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74872] Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM_014586) is a VGAM2160 host target gene. HUNK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HUNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUNK BINDING SITE, designated SEQ ID:15954, to the nucleotide sequence of VGAM2160 RNA, herein designated VGAM RNA, also designated SEQ ID:4871.

[74873] A function of VGAM2160 is therefore inhibition of Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM_014586). Accordingly, utilities of VGAM2160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUNK. Splicing Factor, Arginine/serine-rich 7, 35kDa (SFRS7, Accession XM_002575) is another VGAM2160 host target gene. SFRS7 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by SFRS7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS7 BINDING SITE, designated SEQ ID:29900, to the nucleotide sequence of VGAM2160 RNA, herein designated VGAM RNA, also designated SEQ ID:4871.

[74874] Another function of VGAM2160 is therefore inhibition of Splicing Factor, Arginine/serine-rich 7, 35kDa (SFRS7, Accession XM_002575), a gene which is required for pre-mnra splicing. Accordingly, utilities of VGAM2160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS7. The function of SFRS7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191.ARNTL2 (Accession NM_020183) is another VGAM2160 host target gene. ARNTL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARNTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNTL2

BINDING SITE, designated SEQ ID:21412, to the nucleotide sequence of VGAM2160 RNA, herein designated VGAM RNA, also designated SEQ ID:4871.

[74875] Another function of VGAM2160 is therefore inhibition of ARNTL2 (Accession NM_020183). Accordingly, utilities of VGAM2160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNTL2. FLJ12592 (Accession NM_032169) is another VGAM2160 host target gene. FLJ12592 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12592, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12592 BINDING SITE, designated SEQ ID:25875, to the nucleotide sequence of VGAM2160 RNA, herein designated VGAM RNA, also designated SEQ ID:4871.

[74876] Another function of VGAM2160 is therefore inhibition of FLJ12592 (Accession NM_032169). Accordingly, utilities of VGAM2160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12592. Hepatitis B Virus X Associated Protein (HBXAP, Accession NM_016578) is another VGAM2160 host target

gene. HBXAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HBXAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HBXAP BINDING SITE, designated SEQ ID:18657, to the nucleotide sequence of VGAM2160 RNA, herein designated VGAM RNA, also designated SEQ ID:4871.

[74877] Another function of VGAM2160 is therefore inhibition of Hepatitis B Virus X Associated Protein (HBXAP, Accession NM_016578). Accordingly, utilities of VGAM2160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HBXAP. KIAA0776 (Accession XM_035970) is another VGAM2160 host target gene. KIAA0776 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0776 BINDING SITE, designated SEQ ID:32363, to the nucleotide sequence of VGAM2160 RNA, herein designated VGAM RNA, also designated SEQ

ID:4871.

[74878] Another function of VGAM2160 is therefore inhibition of KIAA0776 (Accession XM_035970). Accordingly, utilities of VGAM2160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0776. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2161 (VGAM2161) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74879] VGAM2161 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2161 was detected is described hereinabove with reference to Figs. 1-8.

[74880] VGAM2161 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2161 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74881] VGAM2161 gene encodes a VGAM2161 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2161 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2161 precursor RNA is designated SEQ ID:2147, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2147 is located at position 194827 relative to the genome of Camelpox Virus.

[74882] VGAM2161 precursor RNA folds onto itself, forming VGAM2161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74883] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2161 folded precursor RNA into VGAM2161 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2161 RNA is designated SEQ ID:4872, and is provided hereinbelow with reference to the sequence listing part.

[74884] VGAM2161 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2161 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2161 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74885] VGAM2161 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2161 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2161 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2161 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2161 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74886] The complementary binding of VGAM2161 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2161 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2161 host target RNA into VGAM2161 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74887] It is appreciated that VGAM2161 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2161 host target genes. The mRNA of

each one of this plurality of VGAM2161 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2161 RNA, herein designated VGAM RNA, and which when bound by VGAM2161 RNA causes inhibition of translation of respective one or more VGAM2161 host target proteins.

[74888] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2161 gene, herein designated VGAM GENE, on one or more VGAM2161 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[74889] It is yet further appreciated that a function of VGAM2161 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2161 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2161 correlate with, and may be deduced from, the identity of the host target genes which VGAM2161 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74890] Nucleotide sequences of the VGAM2161 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2161 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2161 are further described hereinbelow with reference to Table 1.

[74891] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2161 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2161 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74892] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2161 gene, herein designated VGAM is inhibition of expression of VGAM2161 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2161 correlate with, and may be deduced from, the identity of the target genes which VGAM2161 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74893] DKFZp566D133 (Accession XM_050005) is a VGAM2161 host target gene. DKFZp566D133 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp566D133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566D133 BINDING SITE, designated SEQ ID:35545, to the nucleotide sequence of VGAM2161 RNA, herein designated VGAM RNA, also designated SEQ ID:4872.

[74894] A function of VGAM2161 is therefore inhibition of DKFZp566D133 (Accession XM_050005). Accordingly, utilities of VGAM2161 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp566D133. SBBI31 (Accession NM_014035) is another VGAM2161 host target gene. SBBI31 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SBBI31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBBI31 BINDING SITE, designated SEQ ID:15264, to the nucleotide sequence of VGAM2161 RNA, herein designated VGAM RNA, also designated SEQ ID:4872.

[74895] Another function of VGAM2161 is therefore inhibition of SBBI31 (Accession NM_014035). Accordingly, utilities of VGAM2161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBBI31. LOC253959 (Accession XM_170749) is another VGAM2161 host target gene. LOC253959 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253959, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253959 BINDING SITE, designated SEQ ID:45511, to

the nucleotide sequence of VGAM2161 RNA, herein designated VGAM RNA, also designated SEQ ID:4872.

[74896] Another function of VGAM2161 is therefore inhibition of LOC253959 (Accession XM_170749). Accordingly, utilities of VGAM2161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253959. LOC57107 (Accession NM_020381) is another VGAM2161 host target gene. LOC57107 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57107 BINDING SITE, designated SEQ ID:21647, to the nucleotide sequence of VGAM2161 RNA, herein designated VGAM RNA, also designated SEQ ID:4872.

[74897] Another function of VGAM2161 is therefore inhibition of LOC57107 (Accession NM_020381). Accordingly, utilities of VGAM2161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57107. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2162 (VGAM2162) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74898] VGAM2162 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2162 was detected is described hereinabove with reference to Figs. 1-8.

[74899] VGAM2162 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2162 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74900] VGAM2162 gene encodes a VGAM2162 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2162 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2162 precursor RNA is designated SEQ ID:2148, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2148 is located at position 195253 relative to the genome of Camelpox Virus.

[74901] VGAM2162 precursor RNA folds onto itself, forming VGAM2162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74902] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2162 folded precursor RNA into VGAM2162 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2162 RNA is designated SEQ ID:4873, and is provided hereinbelow with reference to the sequence listing part.

[74903] VGAM2162 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2162 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2162 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74904] VGAM2162 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2162 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2162 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2162 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2162 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74905] The complementary binding of VGAM2162 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2162 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2162 host target RNA into VGAM2162 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74906] It is appreciated that VGAM2162 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2162 host target genes. The mRNA of each one of this plurality of VGAM2162 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2162 RNA, herein designated VGAM RNA, and which when bound by VGAM2162 RNA causes inhibition of translation of respective one or more VGAM2162 host target proteins.

[74907] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2162 gene, herein designated VGAM GENE, on one or more VGAM2162 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74908] It is yet further appreciated that a function of VGAM2162 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2162 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2162 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74909] Nucleotide sequences of the VGAM2162 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2162 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2162 are further described hereinbelow with reference to Table 1.

[74910] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2162 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2162 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74911] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2162 gene, herein designated VGAM is inhibition of expression of VGAM2162 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2162 correlate with, and may be deduced from, the identity of the target genes which VGAM2162

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74912] Estrogen-related Receptor Gamma (ESRRG, Accession XM_039053) is a VGAM2162 host target gene. ESRRG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESRRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRG BINDING SITE, designated SEQ ID:32999, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74913] A function of VGAM2162 is therefore inhibition of Estrogen-related Receptor Gamma (ESRRG, Accession XM_039053), a gene which Estrogen-related receptor gamma. Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRG. The function of ESRRG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM359.Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Acces-

sion NM_002209) is another VGAM2162 host target gene. ITGAL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAL BINDING SITE, designated SEQ ID:7972, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74914] Another function of VGAM2162 is therefore inhibition of Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209), a gene which s a receptor for icam1, icam2, icam3 and icam4. it is involved in a variety of immune phenomena including leukocyte-endothelial cell interaction, cytotoxic t-cell mediated killing, and antibody dependent killing by granulocytes and monocytes. Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAL. The function of ITGAL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Nuclear Fragile X

Mental Retardation Protein Interacting Protein 1 (NUFIP1, Accession NM_012345) is another VGAM2162 host target gene. NUFIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUFIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUFIP1 BINDING SITE, designated SEQ ID:14737, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74915] Another function of VGAM2162 is therefore inhibition of Nuclear Fragile X Mental Retardation Protein Interacting Protein 1 (NUFIP1, Accession NM_012345), a gene which binds and colocalizes with nuclear fragile X mental retardation protein. Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUFIP1. The function of NUFIP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM733.POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM_006235) is another VGAM2162 host target gene.

POU2AF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POU2AF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:12892, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74916] Another function of VGAM2162 is therefore inhibition of POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM_006235), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2. Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU2AF1. The function of POU2AF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM171.Recombination Activating Gene 2 (RAG2, Accession XM_089839) is another VGAM2162 host target gene. RAG2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

RAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAG2 BINDING SITE, designated SEQ ID:39985, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74917] Another function of VGAM2162 is therefore inhibition of Recombination Activating Gene 2 (RAG2, Accession XM_089839). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG2. Tensin (TNS, Accession NM_022648) is another VGAM2162 host target gene. TNS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNS BINDING SITE, designated SEQ ID:22903, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74918] Another function of VGAM2162 is therefore inhibition of Tensin (TNS, Accession NM_022648). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with TNS. DKFZP434I092 (Accession XM_042042) is another VGAM2162 host target gene. DKFZP434I092 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434I092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I092 BINDING SITE, designated SEQ ID:33673, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74919] Another function of VGAM2162 is therefore inhibition of DKFZP434I092 (Accession XM_042042). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I092. FLJ10656 (Accession NM_018170) is another VGAM2162 host target gene. FLJ10656 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10656 BINDING SITE, designated SEQ ID:19988, to the

nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74920] Another function of VGAM2162 is therefore inhibition of FLJ10656 (Accession NM_018170). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10656. GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412) is another VGAM2162 host target gene. GABARAPL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABARAPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL1 BINDING SITE, designated SEQ ID:25392, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74921] Another function of VGAM2162 is therefore inhibition of GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL1. GABA(A) Receptors Associated Protein Like 3

(GABARAPL3, Accession NM_032568) is another VGAM2162 host target gene. GABARAPL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABARAPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL3 BINDING SITE, designated SEQ ID:26300, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74922] Another function of VGAM2162 is therefore inhibition of GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL3. HT002 (Accession NM_014066) is another VGAM2162 host target gene. HT002 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HT002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT002 BINDING SITE, designated SEQ ID:15281, to the nucleotide sequence of

VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74923] Another function of VGAM2162 is therefore inhibition of HT002 (Accession NM_014066). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT002. KIAA0475 (Accession NM_014864) is another VGAM2162 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16949, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74924] Another function of VGAM2162 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. KIAA0712 (Accession NM_014715) is another VGAM2162 host target gene. KIAA0712 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by KIAA0712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0712 BINDING SITE, designated SEQ ID:16262, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74925] Another function of VGAM2162 is therefore inhibition of KIAA0712 (Accession NM_014715). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0712. KIAA1301 (Accession XM_038999) is another VGAM2162 host target gene. KIAA1301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1301 BINDING SITE, designated SEQ ID:32978, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74926] Another function of VGAM2162 is therefore inhibition of KIAA1301 (Accession XM_038999). Accordingly, utilities

of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1301. Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869) is another VGAM2162 host target gene. SEZ6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEZ6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEZ6 BINDING SITE, designated SEQ ID:36774, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74927] Another function of VGAM2162 is therefore inhibition of Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEZ6. VMP1 (Accession NM_030938) is another VGAM2162 host target gene. VMP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of VMP1 BINDING SITE, designated SEQ ID:25204, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74928] Another function of VGAM2162 is therefore inhibition of VMP1 (Accession NM_030938). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VMP1. LOC115110 (Accession XM_049825) is another VGAM2162 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:35503, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74929] Another function of VGAM2162 is therefore inhibition of LOC115110 (Accession XM_049825). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC132235 (Accession XM_072302) is another VGAM2162 host target gene. LOC132235 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC132235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132235 BINDING SITE, designated SEQ ID:37483, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74930] Another function of VGAM2162 is therefore inhibition of LOC132235 (Accession XM_072302). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132235. LOC142941 (Accession XM_096363) is another VGAM2162 host target gene. LOC142941 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC142941, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142941 BINDING SITE, designated SEQ ID:40322, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74931] Another function of VGAM2162 is therefore inhibition of

LOC142941 (Accession XM_096363). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142941. LOC158549 (Accession XM_098963) is another VGAM2162 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42007, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74932] Another function of VGAM2162 is therefore inhibition of LOC158549 (Accession XM_098963). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158549. LOC221882 (Accession XM_166507) is another VGAM2162 host target gene. LOC221882 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC221882 BINDING SITE, designated SEQ ID:44434, to the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, also designated SEQ ID:4873.

[74933] Another function of VGAM2162 is therefore inhibition of LOC221882 (Accession XM_166507). Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221882. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2163 (VGAM2163) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74934] VGAM2163 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2163 was detected is described hereinabove with reference to Figs. 1-8.

[74935] VGAM2163 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2163 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[74936] VGAM2163 gene encodes a VGAM2163 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2163 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2163 precursor RNA is designated SEQ ID:2149, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2149 is located at position 184394 relative to the genome of Camelpox Virus.

[74937] VGAM2163 precursor RNA folds onto itself, forming VGAM2163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74938] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2163 folded precursor RNA into VGAM2163 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2163 RNA is designated SEQ ID:4874, and is provided hereinbelow with reference to the sequence listing part.

[74939] VGAM2163 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2163 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2163 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74940] VGAM2163 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2163 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2163 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2163 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2163 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74941] The complementary binding of VGAM2163 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2163 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2163 host target RNA into VGAM2163 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74942] It is appreciated that VGAM2163 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2163 host target genes. The mRNA of each one of this plurality of VGAM2163 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2163 RNA, herein designated VGAM RNA, and which when bound by VGAM2163 RNA causes inhibition of translation of respective one or more VGAM2163 host target proteins.

[74943] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2163 gene, herein designated VGAM GENE, on one or more VGAM2163 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74944] It is yet further appreciated that a function of VGAM2163 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2163 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2163 correlate with, and may be deduced from, the identity of the host target genes which VGAM2163 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74945] Nucleotide sequences of the VGAM2163 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2163 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2163 are further described hereinbelow with reference to Table 1.

[74946] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2163 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2163 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74947] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2163 gene, herein designated VGAM is inhibition of expression of VGAM2163 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2163 correlate with, and may be deduced from, the identity of the target genes which VGAM2163 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74948] Chromosome 9 Open Reading Frame 12 (C9orf12, Accession NM_022755) is a VGAM2163 host target gene. C9orf12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf12 BINDING SITE, designated SEQ ID:22990, to the nucleotide sequence of VGAM2163 RNA, herein designated VGAM RNA, also designated SEQ

ID:4874.

[74949] A function of VGAM2163 is therefore inhibition of Chromosome 9 Open Reading Frame 12 (C9orf12, Accession NM_022755). Accordingly, utilities of VGAM2163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf12. DKFZP564F013 (Accession XM_168479) is another VGAM2163 host target gene. DKFZP564F013 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564F013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564F013 BINDING SITE, designated SEQ ID:45205, to the nucleotide sequence of VGAM2163 RNA, herein designated VGAM RNA, also designated SEQ ID:4874.

[74950] Another function of VGAM2163 is therefore inhibition of DKFZP564F013 (Accession XM_168479). Accordingly, utilities of VGAM2163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564F013. LOC199923 (Accession XM_114057) is another VGAM2163 host target gene. LOC199923 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by LOC199923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199923 BINDING SITE, designated SEQ ID:42665, to the nucleotide sequence of VGAM2163 RNA, herein designated VGAM RNA, also designated SEQ ID:4874.

[74951] Another function of VGAM2163 is therefore inhibition of LOC199923 (Accession XM_114057). Accordingly, utilities of VGAM2163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199923. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2164 (VGAM2164) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74952] VGAM2164 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2164 was detected is described hereinabove with reference to Figs. 1-8.

[74953] VGAM2164 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip Yellow Fleck Virus. VGAM2164 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74954] VGAM2164 gene encodes a VGAM2164 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2164 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2164 precursor RNA is designated SEQ ID:2150, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2150 is located at position 4805 relative to the genome of Parsnip Yellow Fleck Virus.

[74955] VGAM2164 precursor RNA folds onto itself, forming VGAM2164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[74956] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2164 folded precursor RNA into VGAM2164 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2164 RNA is designated SEQ ID:4875, and is provided hereinbelow with reference to the sequence listing part.

[74957] VGAM2164 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2164 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2164 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74958] VGAM2164 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2164 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2164 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2164 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2164 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74959] The complementary binding of VGAM2164 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2164 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2164 host target RNA into VGAM2164 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74960] It is appreciated that VGAM2164 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2164 host target genes. The mRNA of each one of this plurality of VGAM2164 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2164 RNA, herein designated VGAM RNA, and which when bound by VGAM2164 RNA causes inhibition of translation of respective one or more VGAM2164 host target proteins.

[74961] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2164 gene, herein designated VGAM GENE, on one or more VGAM2164 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74962] It is yet further appreciated that a function of VGAM2164 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2164 include diagnosis, prevention and treatment of viral infection by Parsnip Yellow Fleck Virus. Specific functions, and accordingly utilities, of VGAM2164 correlate with, and may be deduced from, the identity of the host target genes which VGAM2164 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74963] Nucleotide sequences of the VGAM2164 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2164 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2164 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2164 are further described hereinbelow with reference to Table 1.

[74964] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2164 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2164 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74965] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2164 gene, herein designated VGAM is inhibition of expression of VGAM2164 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2164 correlate with, and may be deduced from, the identity of the target genes which VGAM2164 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74966] Interleukin 6 Receptor (IL6R, Accession NM_000565) is a VGAM2164 host target gene. IL6R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL6R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of IL6R BINDING SITE, designated SEQ ID:6171, to the nucleotide sequence of VGAM2164 RNA, herein designated VGAM RNA, also designated SEQ ID:4875.

[74967] A function of VGAM2164 is therefore inhibition of Interleukin 6 Receptor (IL6R, Accession NM_000565), a gene which is essential to the regulation of the immune response, hematopoiesis, and acute-phase reactions. Accordingly, utilities of VGAM2164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL6R. The function of IL6R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189.XT3 (Accession NM_020208) is another VGAM2164 host target gene. XT3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XT3 BINDING SITE, designated SEQ ID:21441, to the nucleotide sequence of VGAM2164 RNA, herein designated VGAM RNA, also designated SEQ ID:4875.

[74968] Another function of VGAM2164 is therefore inhibition of XT3 (Accession NM_020208), a gene which is a Kidney-specific orphan transporter. Accordingly, utilities of VGAM2164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XT3. The function of XT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM21.F-box Only Protein 9 (FBXO9, Accession NM_033480) is another VGAM2164 host target gene. FBXO9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXO9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO9 BINDING SITE, designated SEQ ID:27257, to the nucleotide sequence of VGAM2164 RNA, herein designated VGAM RNA, also designated SEQ ID:4875.

[74969] Another function of VGAM2164 is therefore inhibition of F-box Only Protein 9 (FBXO9, Accession NM_033480). Accordingly, utilities of VGAM2164 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with FBXO9. FLJ14840 (Accession NM_032850) is another VGAM2164 host target gene. FLJ14840 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14840, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14840 BINDING SITE, designated SEQ ID:26644, to the nucleotide sequence of VGAM2164 RNA, herein designated VGAM RNA, also designated SEQ ID:4875.

[74970] Another function of VGAM2164 is therefore inhibition of FLJ14840 (Accession NM_032850). Accordingly, utilities of VGAM2164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14840. Nup43 (Accession NM_024647) is another VGAM2164 host target gene. Nup43 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Nup43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nup43 BINDING SITE, designated SEQ ID:23932, to the nucleotide sequence of VGAM2164 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4875.

[74971] Another function of VGAM2164 is therefore inhibition of Nup43 (Accession NM_024647). Accordingly, utilities of VGAM2164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Nup43. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335) is another VGAM2164 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30684, to the nucleotide sequence of VGAM2164 RNA, herein designated VGAM RNA, also designated SEQ ID:4875.

[74972] Another function of VGAM2164 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335). Accordingly, utilities of VGAM2164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8. YME1-like 1 (S. cerevisiae) (YME1L1, Accession NM_139312) is another VGAM2164 host target gene.

YME1L1 BINDING SITE1 and YME1L1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by YME1L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YME1L1 BINDING SITE1 and YME1L1 BINDING SITE2, designated SEQ ID:29292 and SEQ ID:15536 respectively, to the nucleotide sequence of VGAM2164 RNA, herein designated VGAM RNA, also designated SEQ ID:4875.

[74973] Another function of VGAM2164 is therefore inhibition of YME1-like 1 (S. cerevisiae) (YME1L1, Accession NM_139312). Accordingly, utilities of VGAM2164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YME1L1. LOC147664 (Accession XM_085826) is another VGAM2164 host target gene. LOC147664 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147664 BINDING SITE, designated SEQ ID:38352, to the nucleotide sequence of

VGAM2164 RNA, herein designated VGAM RNA, also designated SEQ ID:4875.

[74974] Another function of VGAM2164 is therefore inhibition of LOC147664 (Accession XM_085826). Accordingly, utilities of VGAM2164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147664. LOC51336 (Accession NM_016646) is another VGAM2164 host target gene. LOC51336 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51336 BINDING SITE, designated SEQ ID:18755, to the nucleotide sequence of VGAM2164 RNA, herein designated VGAM RNA, also designated SEQ ID:4875.

[74975] Another function of VGAM2164 is therefore inhibition of LOC51336 (Accession NM_016646). Accordingly, utilities of VGAM2164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51336. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2165 (VGAM2165) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74976] VGAM2165 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2165 was detected is described hereinabove with reference to Figs. 1-8.

[74977] VGAM2165 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2165 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74978] VGAM2165 gene encodes a VGAM2165 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2165 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2165 precursor RNA is designated SEQ ID:2151, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2151 is located at position 196786 relative to the genome of Camelpox Virus.

[74979] VGAM2165 precursor RNA folds onto itself, forming VGAM2165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74980] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2165 folded precursor RNA into VGAM2165 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2165 RNA is designated SEQ ID:4876, and is provided hereinbelow with reference to the sequence listing part.

[74981] VGAM2165 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2165 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2165 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74982] VGAM2165 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2165 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2165 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2165 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2165 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74983] The complementary binding of VGAM2165 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2165 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2165 host target RNA into VGAM2165 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74984] It is appreciated that VGAM2165 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2165 host target genes. The mRNA of each one of this plurality of VGAM2165 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2165 RNA, herein designated VGAM RNA, and which when bound by VGAM2165 RNA causes inhibition of translation of respective one or more VGAM2165 host target proteins.

[74985] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2165 gene, herein designated VGAM GENE, on one or more VGAM2165 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74986] It is yet further appreciated that a function of VGAM2165 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2165 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2165 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2165 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74987] Nucleotide sequences of the VGAM2165 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2165 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2165 are further described hereinbelow with reference to Table 1.

[74988] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2165 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2165 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74989] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2165 gene, herein designated VGAM is inhibition of expression of VGAM2165 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2165 correlate with, and may be deduced from, the identity of the target genes which VGAM2165

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74990] Ephrin-B2 (EFNB2, Accession NM_004093) is a VGAM2165 host target gene. EFNB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EFNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB2 BINDING SITE, designated SEQ ID:10295, to the nucleotide sequence of VGAM2165 RNA, herein designated VGAM RNA, also designated SEQ ID:4876.

[74991] A function of VGAM2165 is therefore inhibition of Ephrin-B2 (EFNB2, Accession NM_004093). Accordingly, utilities of VGAM2165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNB2. Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM_047295) is another VGAM2165 host target gene. EPB41L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPB41L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:34938, to the nucleotide sequence of VGAM2165 RNA, herein designated VGAM RNA, also designated SEQ ID:4876.

[74992] Another function of VGAM2165 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM_047295). Accordingly, utilities of VGAM2165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1. GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568) is another VGAM2165 host target gene. GABARAPL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABARAPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL3 BINDING SITE, designated SEQ ID:26295, to the nucleotide sequence of VGAM2165 RNA, herein designated VGAM RNA, also designated SEQ ID:4876.

[74993] Another function of VGAM2165 is therefore inhibition of GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568). Accordingly, utilities of

VGAM2165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL3. KIAA0265 (Accession XM_045954) is another VGAM2165 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:34621, to the nucleotide sequence of VGAM2165 RNA, herein designated VGAM RNA, also designated SEQ ID:4876.

[74994] Another function of VGAM2165 is therefore inhibition of KIAA0265 (Accession XM_045954). Accordingly, utilities of VGAM2165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265. MGC13105 (Accession XM_049394) is another VGAM2165 host target gene. MGC13105 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC13105, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC13105 BINDING SITE, designated SEQ ID:35407, to the nucleotide sequence of VGAM2165 RNA, herein designated VGAM RNA, also designated SEQ ID:4876.

[74995] Another function of VGAM2165 is therefore inhibition of MGC13105 (Accession XM_049394). Accordingly, utilities of VGAM2165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13105. LOC222681 (Accession XM_167116) is another VGAM2165 host target gene. LOC222681 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222681 BINDING SITE, designated SEQ ID:44606, to the nucleotide sequence of VGAM2165 RNA, herein designated VGAM RNA, also designated SEQ ID:4876.

[74996] Another function of VGAM2165 is therefore inhibition of LOC222681 (Accession XM_167116). Accordingly, utilities of VGAM2165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222681. LOC255995 (Accession XM_173071) is another VGAM2165 host target gene. LOC255995 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255995, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255995 BINDING SITE, designated SEQ ID:46323, to the nucleotide sequence of VGAM2165 RNA, herein designated VGAM RNA, also designated SEQ ID:4876.

[74997] Another function of VGAM2165 is therefore inhibition of LOC255995 (Accession XM_173071). Accordingly, utilities of VGAM2165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255995. LOC257507 (Accession XM_175204) is another VGAM2165 host target gene. LOC257507 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257507 BINDING SITE, designated SEQ ID:46672, to the nucleotide sequence of VGAM2165 RNA, herein designated VGAM RNA, also designated SEQ ID:4876.

[74998] Another function of VGAM2165 is therefore inhibition of

LOC257507 (Accession XM_175204). Accordingly, utilities of VGAM2165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257507. LOC257625 (Accession XM_175267) is another VGAM2165 host target gene. LOC257625 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257625 BINDING SITE, designated SEQ ID:46728, to the nucleotide sequence of VGAM2165 RNA, herein designated VGAM RNA, also designated SEQ ID:4876.

[74999] Another function of VGAM2165 is therefore inhibition of LOC257625 (Accession XM_175267). Accordingly, utilities of VGAM2165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257625. LOC90777 (Accession XM_034052) is another VGAM2165 host target gene. LOC90777 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90777, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC90777 BINDING SITE, designated SEQ ID:31991, to the nucleotide sequence of VGAM2165 RNA, herein designated VGAM RNA, also designated SEQ ID:4876.

[75000] Another function of VGAM2165 is therefore inhibition of LOC90777 (Accession XM_034052). Accordingly, utilities of VGAM2165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90777. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2166 (VGAM2166) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75001] VGAM2166 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2166 was detected is described hereinabove with reference to Figs. 1-8.

[75002] VGAM2166 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2166 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[75003] VGAM2166 gene encodes a VGAM2166 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2166 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2166 precursor RNA is designated SEQ ID:2152, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2152 is located at position 186373 relative to the genome of Camelpox Virus.

[75004] VGAM2166 precursor RNA folds onto itself, forming VGAM2166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75005] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2166 folded precursor RNA into VGAM2166 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2166 RNA is designated SEQ ID:4877, and is provided hereinbelow with reference to the sequence listing part.

[75006] VGAM2166 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2166 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2166 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75007] VGAM2166 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2166 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2166 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2166 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2166 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75008] The complementary binding of VGAM2166 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2166 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2166 host target RNA into VGAM2166 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75009] It is appreciated that VGAM2166 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2166 host target genes. The mRNA of each one of this plurality of VGAM2166 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2166 RNA, herein designated VGAM RNA, and which when bound by VGAM2166 RNA causes inhibition of translation of respective one or more VGAM2166 host target proteins.

[75010] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2166 gene, herein designated VGAM GENE, on one or more VGAM2166 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75011] It is yet further appreciated that a function of VGAM2166 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2166 correlate with, and may be deduced from, the identity of the host target genes which VGAM2166 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75012] Nucleotide sequences of the VGAM2166 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2166 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2166 are further described hereinbelow with reference to Table 1.

[75013] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2166 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2166 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75014] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2166 gene, herein designated VGAM is inhibition of expression of VGAM2166 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2166 correlate with, and may be deduced from, the identity of the target genes which VGAM2166 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75015] BIG1 (Accession NM_006421) is a VGAM2166 host target gene. BIG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIG1 BINDING SITE, designated SEQ ID:13138, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75016] A function of VGAM2166 is therefore inhibition of BIG1

(Accession NM_006421), a gene which is a guanine nucleotide-exchange protein, has a role in vesicular transport. Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIG1. The function of BIG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1190.E2F Transcription Factor 3 (E2F3, Accession NM_001949) is another VGAM2166 host target gene. E2F3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by E2F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2F3 BINDING SITE, designated SEQ ID:7669, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75017] Another function of VGAM2166 is therefore inhibition of E2F Transcription Factor 3 (E2F3, Accession NM_001949), a gene which binds dna and controls cell-cycle progression from g1 to s phase. Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with E2F3. The function of E2F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475.Potassium Channel, Subfamily K, Member 6 (KCNK6, Accession NM_004823) is another VGAM2166 host target gene. KCNK6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK6 BINDING SITE, designated SEQ ID:11239, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75018] Another function of VGAM2166 is therefore inhibition of Potassium Channel, Subfamily K, Member 6 (KCNK6, Accession NM_004823), a gene which is an inward rectifying potassium channel protein. Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK6. The function of KCNK6 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM1190.RNA Binding Motif Protein 8A (RBM8A, Accession NM_005105) is another VGAM2166 host target gene. RBM8A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBM8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM8A BINDING SITE, designated SEQ ID:11577, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75019] Another function of VGAM2166 is therefore inhibition of RNA Binding Motif Protein 8A (RBM8A, Accession NM_005105), a gene which involves in the pathway of gene expression postsplicing nuclear preexport mRNPs, and newly exported cytoplasmic mRNPs. Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM8A. The function of RBM8A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1864.Stearoyl-CoA Desaturase

(delta-9-desaturase) (SCD, Accession NM_005063) is another VGAM2166 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:11494, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75020] Another function of VGAM2166 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM314.H2AV (Accession NM_138635) is another VGAM2166 host target gene. H2AV BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H2AV, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AV BINDING SITE, designated SEQ ID:28909, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75021] Another function of VGAM2166 is therefore inhibition of H2AV (Accession NM_138635). Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AV. KIAA0410 (Accession NM_014778) is another VGAM2166 host target gene. KIAA0410 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0410, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0410 BINDING SITE, designated SEQ ID:16621, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75022] Another function of VGAM2166 is therefore inhibition of KIAA0410 (Accession NM_014778). Accordingly, utilities of VGAM2166 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0410. KIAA0795 (Accession NM_025010) is another VGAM2166 host target gene. KIAA0795 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0795 BINDING SITE, designated SEQ ID:24582, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75023] Another function of VGAM2166 is therefore inhibition of KIAA0795 (Accession NM_025010). Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0795. KIAA1786 (Accession XM_038436) is another VGAM2166 host target gene. KIAA1786 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1786 BINDING SITE, designated SEQ ID:32846, to the

nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75024] Another function of VGAM2166 is therefore inhibition of KIAA1786 (Accession XM_038436). Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1786. KIAA1900 (Accession XM_055299) is another VGAM2166 host target gene. KIAA1900 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1900 BINDING SITE, designated SEQ ID:36262, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75025] Another function of VGAM2166 is therefore inhibition of KIAA1900 (Accession XM_055299). Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1900. RAP140 (Accession NM_015224) is another VGAM2166 host target gene. RAP140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by RAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP140 BINDING SITE, designated SEQ ID:17559, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75026] Another function of VGAM2166 is therefore inhibition of RAP140 (Accession NM_015224). Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP140. RNA Binding Motif Protein 7 (RBM7, Accession NM_016090) is another VGAM2166 host target gene. RBM7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM7 BINDING SITE, designated SEQ ID:18179, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75027] Another function of VGAM2166 is therefore inhibition of RNA Binding Motif Protein 7 (RBM7, Accession

NM_016090). Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM7. LOC145820 (Accession XM_085246) is another VGAM2166 host target gene. LOC145820 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145820 BINDING SITE, designated SEQ ID:37988, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75028] Another function of VGAM2166 is therefore inhibition of LOC145820 (Accession XM_085246). Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145820. LOC150587 (Accession XM_097917) is another VGAM2166 host target gene. LOC150587 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150587, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC150587 BINDING SITE, designated SEQ ID:41213, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75029] Another function of VGAM2166 is therefore inhibition of LOC150587 (Accession XM_097917). Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150587. LOC197003 (Accession XM_113798) is another VGAM2166 host target gene. LOC197003 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197003, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197003 BINDING SITE, designated SEQ ID:42443, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75030] Another function of VGAM2166 is therefore inhibition of LOC197003 (Accession XM_113798). Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197003. LOC54505 (Accession XM_042110) is an-

other VGAM2166 host target gene. LOC54505 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC54505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54505 BINDING SITE, designated SEQ ID:33696, to the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, also designated SEQ ID:4877.

[75031] Another function of VGAM2166 is therefore inhibition of LOC54505 (Accession XM_042110). Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54505. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2167 (VGAM2167) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75032] VGAM2167 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2167 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[75033] VGAM2167 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip Yellow Fleck Virus. VGAM2167 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75034] VGAM2167 gene encodes a VGAM2167 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2167 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2167 precursor RNA is designated SEQ ID:2153, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2153 is located at position 7389 relative to the genome of Parsnip Yellow Fleck Virus.

[75035] VGAM2167 precursor RNA folds onto itself, forming VGAM2167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75036] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2167 folded precursor RNA into VGAM2167 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2167 RNA is designated SEQ ID:4878, and is provided hereinbelow with reference to the sequence listing part.

[75037] VGAM2167 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2167 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2167 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75038] VGAM2167 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2167 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2167 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2167 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2167 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75039] The complementary binding of VGAM2167 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2167 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2167 host target RNA into VGAM2167 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75040] It is appreciated that VGAM2167 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2167 host target genes. The mRNA of each one of this plurality of VGAM2167 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2167 RNA, herein designated VGAM RNA, and which when bound by VGAM2167 RNA causes inhibition of translation of respective one or more VGAM2167 host target proteins.

[75041] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2167 gene, herein designated VGAM GENE, on one or more VGAM2167 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75042] It is yet further appreciated that a function of VGAM2167 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2167 include diagnosis, prevention and treatment of viral infection by Parsnip Yellow Fleck Virus. Specific functions, and accordingly utilities, of VGAM2167 correlate with, and may be deduced from, the identity of the host target genes which VGAM2167 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75043] Nucleotide sequences of the VGAM2167 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2167 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2167 are further described hereinbelow with reference to Table 1.

[75044] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2167 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2167 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75045] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2167 gene, herein designated VGAM is inhibition of expression of VGAM2167 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2167 correlate with, and may be deduced from, the identity of the target genes which VGAM2167 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75046] Fibroblast Growth Factor 12 (FGF12, Accession NM_021032) is a VGAM2167 host target gene. FGF12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FGF12, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF12 BINDING SITE, designated SEQ ID:22020, to the nucleotide sequence of VGAM2167 RNA, herein designated VGAM RNA, also designated SEQ ID:4878.

[75047] A function of VGAM2167 is therefore inhibition of Fibroblast Growth Factor 12 (FGF12, Accession NM_021032), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM2167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF12. The function of FGF12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1025.DKFZP434G1411 (Accession XM_166383) is another VGAM2167 host target gene. DKFZP434G1411 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434G1411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434G1411 BINDING SITE, designated SEQ ID:44233, to the nucleotide sequence of

VGAM2167 RNA, herein designated VGAM RNA, also designated SEQ ID:4878.

[75048] Another function of VGAM2167 is therefore inhibition of DKFZP434G1411 (Accession XM_166383). Accordingly, utilities of VGAM2167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434G1411. Golgi Reassembly Stacking Protein 2, 55kDa (GORASP2, Accession NM_015530) is another VGAM2167 host target gene. GORASP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GORASP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GORASP2 BINDING SITE, designated SEQ ID:17797, to the nucleotide sequence of VGAM2167 RNA, herein designated VGAM RNA, also designated SEQ ID:4878.

[75049] Another function of VGAM2167 is therefore inhibition of Golgi Reassembly Stacking Protein 2, 55kDa (GORASP2, Accession NM_015530). Accordingly, utilities of VGAM2167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GORASP2. KIAA1396 (Accession XM_032054) is another

VGAM2167 host target gene. KIAA1396 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1396 BINDING SITE, designated SEQ ID:31545, to the nucleotide sequence of VGAM2167 RNA, herein designated VGAM RNA, also designated SEQ ID:4878.

[75050] Another function of VGAM2167 is therefore inhibition of KIAA1396 (Accession XM_032054). Accordingly, utilities of VGAM2167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1396. LOC220936 (Accession XM_166137) is another VGAM2167 host target gene. LOC220936 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220936 BINDING SITE, designated SEQ ID:43932, to the nucleotide sequence of VGAM2167 RNA, herein designated VGAM RNA, also designated SEQ ID:4878.

[75051] Another function of VGAM2167 is therefore inhibition of LOC220936 (Accession XM_166137). Accordingly, utilities of VGAM2167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220936. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2168 (VGAM2168) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75052] VGAM2168 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2168 was detected is described hereinabove with reference to Figs. 1-8.

[75053] VGAM2168 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip Yellow Fleck Virus. VGAM2168 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75054] VGAM2168 gene encodes a VGAM2168 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2168 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2168 precursor RNA is designated SEQ ID:2154, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2154 is located at position 4305 relative to the genome of Parsnip Yellow Fleck Virus.

[75055] VGAM2168 precursor RNA folds onto itself, forming VGAM2168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75056] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2168 folded precursor RNA into VGAM2168 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2168 RNA is designated SEQ ID:4879, and is provided hereinbelow with reference to the sequence listing part.

[75057] VGAM2168 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2168 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2168 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75058] VGAM2168 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2168 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2168 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2168 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2168 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75059] The complementary binding of VGAM2168 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2168 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2168 host target RNA into VGAM2168 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75060] It is appreciated that VGAM2168 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2168 host target genes. The mRNA of each one of this plurality of VGAM2168 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2168 RNA, herein designated VGAM RNA, and which when bound by VGAM2168 RNA causes inhibition of translation of respective one or more VGAM2168 host target proteins.

[75061] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2168 gene, herein designated VGAM GENE, on one or more VGAM2168 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75062] It is yet further appreciated that a function of VGAM2168 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2168 include diagnosis, prevention and treatment of viral infection by Parsnip Yellow Fleck Virus. Specific functions, and accordingly utilities, of VGAM2168 correlate with, and may be deduced from, the identity of the host target genes which VGAM2168 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75063] Nucleotide sequences of the VGAM2168 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2168 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2168 are further described hereinbelow with reference to Table 1.

[75064] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2168 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2168 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[75065] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2168 gene, herein designated VGAM is inhibition of expression of VGAM2168 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2168 correlate with, and may be deduced from, the identity of the target genes which VGAM2168 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75066] Outer Dense Fiber of Sperm Tails 2 (ODF2, Accession NM_002540) is a VGAM2168 host target gene. ODF2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ODF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ODF2 BINDING SITE, designated SEQ ID:8386, to the nucleotide sequence of VGAM2168 RNA, herein designated VGAM RNA, also designated SEQ ID:4879.

[75067] A function of VGAM2168 is therefore inhibition of Outer Dense Fiber of Sperm Tails 2 (ODF2, Accession NM_002540), a gene which is very strongly similar to rat Odf2 . Accordingly, utilities of VGAM2168 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with ODF2. The function of ODF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM363.Spinocerebellar Ataxia 7 (olivopontocerebellar atrophy with retinal degeneration) (SCA7, Accession NM_000333) is another VGAM2168 host target gene. SCA7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCA7 BINDING SITE, designated SEQ ID:5886, to the nucleotide sequence of VGAM2168 RNA, herein designated VGAM RNA, also designated SEQ ID:4879.

[75068] Another function of VGAM2168 is therefore inhibition of Spinocerebellar Ataxia 7 (olivopontocerebellar atrophy with retinal degeneration) (SCA7, Accession NM_000333). Accordingly, utilities of VGAM2168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCA7. Solute Carrier Family 26, Member 10 (SLC26A10, Accession NM_133489) is another

VGAM2168 host target gene. SLC26A10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC26A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A10 BINDING SITE, designated SEQ ID:28557, to the nucleotide sequence of VGAM2168 RNA, herein designated VGAM RNA, also designated SEQ ID:4879.

[75069] Another function of VGAM2168 is therefore inhibition of Solute Carrier Family 26, Member 10 (SLC26A10, Accession NM_133489). Accordingly, utilities of VGAM2168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A10. LOC158236 (Accession XM_098898) is another VGAM2168 host target gene. LOC158236 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158236 BINDING SITE, designated SEQ ID:41927, to the nucleotide sequence of VGAM2168 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4879.

[75070] Another function of VGAM2168 is therefore inhibition of LOC158236 (Accession XM_098898). Accordingly, utilities of VGAM2168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158236. LOC253264 (Accession XM_170639) is another VGAM2168 host target gene. LOC253264 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253264 BINDING SITE, designated SEQ ID:45417, to the nucleotide sequence of VGAM2168 RNA, herein designated VGAM RNA, also designated SEQ ID:4879.

[75071] Another function of VGAM2168 is therefore inhibition of LOC253264 (Accession XM_170639). Accordingly, utilities of VGAM2168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253264. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2169 (VGAM2169) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75072] VGAM2169 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2169 was detected is described hereinabove with reference to Figs. 1-8.

[75073] VGAM2169 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2169 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75074] VGAM2169 gene encodes a VGAM2169 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2169 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2169 precursor RNA is designated SEQ ID:2155, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2155 is located at position 183939 relative to the genome of Camelpox Virus.

[75075] VGAM2169 precursor RNA folds onto itself, forming

VGAM2169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75076] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2169 folded precursor RNA into VGAM2169 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2169 RNA is designated SEQ ID:4880, and is provided hereinbelow with reference to the sequence listing part.

[75077] VGAM2169 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2169 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2169 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75078] VGAM2169 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2169 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2169 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2169 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2169 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75079] The complementary binding of VGAM2169 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2169 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2169 host target RNA into VGAM2169 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75080] It is appreciated that VGAM2169 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2169 host target genes. The mRNA of each one of this plurality of VGAM2169 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2169 RNA, herein designated VGAM RNA, and which when bound by VGAM2169 RNA causes inhibition of translation of respective one or more VGAM2169 host target proteins.

[75081] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2169 gene, herein designated VGAM GENE, on one or more VGAM2169 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75082] It is yet further appreciated that a function of VGAM2169 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2169 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2169 correlate with, and may be deduced from, the identity of the host target genes which VGAM2169 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[75083] Nucleotide sequences of the VGAM2169 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2169 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2169 are further described hereinbelow with reference to Table 1.

[75084] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2169 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2169 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75085] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2169 gene, herein designated VGAM is inhibition of expression of VGAM2169 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2169 correlate with, and may be deduced from, the identity of the target genes which VGAM2169 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[75086] D10S170 (Accession NM_005436) is a VGAM2169 host target gene. D10S170 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by D10S170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D10S170 BINDING SITE, designated SEQ ID:11918, to the nucleotide sequence of VGAM2169 RNA, herein designated VGAM RNA, also designated SEQ ID:4880.

[75087] A function of VGAM2169 is therefore inhibition of D10S170 (Accession NM_005436), a gene which may provide a structural basis for generation of RET/PTC1 rearrangement . Accordingly, utilities of VGAM2169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D10S170. The function of D10S170 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM142.Deleted In Azoospermia-like (DAZL, Accession XM_042839) is another VGAM2169 host target gene. DAZL BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by DAZL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAZL BINDING SITE, designated SEQ ID:33798, to the nucleotide sequence of VGAM2169 RNA, herein designated VGAM RNA, also designated SEQ ID:4880.

[75088] Another function of VGAM2169 is therefore inhibition of Deleted In Azoospermia-like (DAZL, Accession XM_042839), a gene which may be essential for gametogenesis. Accordingly, utilities of VGAM2169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAZL. The function of DAZL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Dihydrolipoamide Branched Chain Transacylase (E2 component of branched chain keto acid dehydrogenase complex; maple syrup urine disease) (DBT, Accession NM_001918) is another VGAM2169 host target gene. DBT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DBT, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBT BINDING SITE, designated SEQ ID:7632, to the nucleotide sequence of VGAM2169 RNA, herein designated VGAM RNA, also designated SEQ ID:4880.

[75089] Another function of VGAM2169 is therefore inhibition of Dihydrolipoamide Branched Chain Transacylase (E2 component of branched chain keto acid dehydrogenase complex; maple syrup urine disease) (DBT, Accession NM_001918). Accordingly, utilities of VGAM2169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBT. LOC256277 (Accession XM_170644) is another VGAM2169 host target gene. LOC256277 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256277 BINDING SITE, designated SEQ ID:45424, to the nucleotide sequence of VGAM2169 RNA, herein designated VGAM RNA, also designated SEQ ID:4880.

[75090] Another function of VGAM2169 is therefore inhibition of

LOC256277 (Accession XM_170644). Accordingly, utilities of VGAM2169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256277. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2170 (VGAM2170) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75091] VGAM2170 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2170 was detected is described hereinabove with reference to Figs. 1-8.

[75092] VGAM2170 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip Yellow Fleck Virus. VGAM2170 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75093] VGAM2170 gene encodes a VGAM2170 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2170 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2170 precursor RNA is designated SEQ ID:2156, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2156 is located at position 8639 relative to the genome of Parsnip Yellow Fleck Virus.

[75094] VGAM2170 precursor RNA folds onto itself, forming VGAM2170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75095] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2170 folded precursor RNA into VGAM2170 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide se-

quence of VGAM2170 RNA is designated SEQ ID:4881, and is provided hereinbelow with reference to the sequence listing part.

[75096] VGAM2170 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2170 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2170 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75097] VGAM2170 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2170 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2170 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2170 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2170 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75098] The complementary binding of VGAM2170 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2170 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2170 host target RNA into VGAM2170 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75099] It is appreciated that VGAM2170 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2170 host target genes. The mRNA of each one of this plurality of VGAM2170 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2170 RNA, herein designated VGAM RNA, and which when bound by VGAM2170 RNA causes inhibition of translation of respective one or more VGAM2170 host target proteins.

[75100] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2170 gene, herein designated VGAM GENE, on one or more VGAM2170 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75101] It is yet further appreciated that a function of VGAM2170

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2170 include diagnosis, prevention and treatment of viral infection by Parsnip Yellow Fleck Virus. Specific functions, and accordingly utilities, of VGAM2170 correlate with, and may be deduced from, the identity of the host target genes which VGAM2170 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75102] Nucleotide sequences of the VGAM2170 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2170 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2170 are further described hereinbelow with reference to Table 1.

[75103] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2170 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2170 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75104] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2170 gene, herein designated VGAM is inhibition of expression of VGAM2170 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2170 correlate with, and may be deduced from, the identity of the target genes which VGAM2170 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75105] Angiopoietin 1 (ANGPT1, Accession NM_001146) is a VGAM2170 host target gene. ANGPT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ANGPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANGPT1 BINDING SITE, designated SEQ ID:6817, to the nucleotide sequence of VGAM2170 RNA, herein designated VGAM RNA, also designated SEQ ID:4881.

[75106] A function of VGAM2170 is therefore inhibition of Angiopoietin 1 (ANGPT1, Accession NM_001146), a gene which binds and activates tie2 receptor by inducing its tyrosine phosphorylation. Accordingly, utilities of VGAM2170 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ANGPT1. The function of ANGPT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM291.ATPase, Na+/K+ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678) is another VGAM2170 host target gene. ATP1B2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE, designated SEQ ID:7397, to the nucleotide sequence of VGAM2170 RNA, herein designated VGAM RNA, also designated SEQ ID:4881.

[75107] Another function of VGAM2170 is therefore inhibition of ATPase, Na+/K+ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na +/K+ ions across the plasma membrane. Accordingly, utilities of VGAM2170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B2. The function of ATP1B2 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.Adaptor-related Protein Complex 3, Mu 1 Subunit (AP3M1, Accession NM_012095) is another VGAM2170 host target gene. AP3M1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AP3M1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP3M1 BINDING SITE, designated SEQ ID:14397, to the nucleotide sequence of VGAM2170 RNA, herein designated VGAM RNA, also designated SEQ ID:4881.

[75108] Another function of VGAM2170 is therefore inhibition of Adaptor-related Protein Complex 3, Mu 1 Subunit (AP3M1, Accession NM_012095). Accordingly, utilities of VGAM2170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3M1. BHC80 (Accession NM_016621) is another VGAM2170 host target gene. BHC80 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BHC80, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHC80 BINDING SITE, designated SEQ ID:18729, to the nucleotide sequence of VGAM2170 RNA, herein designated VGAM RNA, also designated SEQ ID:4881.

[75109] Another function of VGAM2170 is therefore inhibition of BHC80 (Accession NM_016621). Accordingly, utilities of VGAM2170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHC80. FLJ21916 (Accession NM_023112) is another VGAM2170 host target gene. FLJ21916 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21916 BINDING SITE, designated SEQ ID:23383, to the nucleotide sequence of VGAM2170 RNA, herein designated VGAM RNA, also designated SEQ ID:4881.

[75110] Another function of VGAM2170 is therefore inhibition of FLJ21916 (Accession NM_023112). Accordingly, utilities of VGAM2170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ21916. KIAA0441 (Accession NM_014797) is another VGAM2170 host target gene. KIAA0441 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0441 BINDING SITE, designated SEQ ID:16709, to the nucleotide sequence of VGAM2170 RNA, herein designated VGAM RNA, also designated SEQ ID:4881.

[75111] Another function of VGAM2170 is therefore inhibition of KIAA0441 (Accession NM_014797). Accordingly, utilities of VGAM2170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0441. KIAA1157 (Accession XM_051093) is another VGAM2170 host target gene. KIAA1157 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1157 BINDING SITE, designated SEQ ID:35754, to the nucleotide sequence of VGAM2170 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4881.

[75112] Another function of VGAM2170 is therefore inhibition of KIAA1157 (Accession XM_051093). Accordingly, utilities of VGAM2170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1157. PRO1580 (Accession NM_018502) is another VGAM2170 host target gene. PRO1580 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1580 BINDING SITE, designated SEQ ID:20567, to the nucleotide sequence of VGAM2170 RNA, herein designated VGAM RNA, also designated SEQ ID:4881.

[75113] Another function of VGAM2170 is therefore inhibition of PRO1580 (Accession NM_018502). Accordingly, utilities of VGAM2170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1580. LOC257484 (Accession XM_114232) is another VGAM2170 host target gene. LOC257484 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257484, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257484 BINDING SITE, designated SEQ ID:42814, to the nucleotide sequence of VGAM2170 RNA, herein designated VGAM RNA, also designated SEQ ID:4881.

[75114] Another function of VGAM2170 is therefore inhibition of LOC257484 (Accession XM_114232). Accordingly, utilities of VGAM2170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257484. LOC91351 (Accession XM_037817) is another VGAM2170 host target gene. LOC91351 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91351, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91351 BINDING SITE, designated SEQ ID:32698, to the nucleotide sequence of VGAM2170 RNA, herein designated VGAM RNA, also designated SEQ ID:4881.

[75115] Another function of VGAM2170 is therefore inhibition of LOC91351 (Accession XM_037817). Accordingly, utilities of VGAM2170 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC91351. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2171 (VGAM2171) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75116] VGAM2171 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2171 was detected is described hereinabove with reference to Figs. 1-8.

[75117] VGAM2171 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip Yellow Fleck Virus. VGAM2171 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75118] VGAM2171 gene encodes a VGAM2171 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2171 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2171 precursor RNA is desig-

nated SEQ ID:2157, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2157 is located at position 5077 relative to the genome of Parsnip Yellow Fleck Virus.

[75119] VGAM2171 precursor RNA folds onto itself, forming VGAM2171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75120] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2171 folded precursor RNA into VGAM2171 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2171 RNA is designated SEQ ID:4882, and is provided hereinbelow with reference to the sequence

listing part.

[75121] VGAM2171 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2171 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2171 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75122] VGAM2171 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2171 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2171 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2171 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2171 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75123] The complementary binding of VGAM2171 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2171 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2171 host target RNA into VGAM2171 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75124] It is appreciated that VGAM2171 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2171 host target genes. The mRNA of each one of this plurality of VGAM2171 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2171 RNA, herein designated VGAM

RNA, and which when bound by VGAM2171 RNA causes inhibition of translation of respective one or more VGAM2171 host target proteins.

[75125] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2171 gene, herein designated VGAM GENE, on one or more VGAM2171 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75126] It is yet further appreciated that a function of VGAM2171 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2171 include diagnosis, prevention and treatment of viral infection by Parsnip Yellow Fleck Virus. Specific functions, and accordingly utilities, of VGAM2171 correlate with, and may be deduced from, the identity of the host target genes which VGAM2171 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75127] Nucleotide sequences of the VGAM2171 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2171 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2171 are further described hereinbelow with reference to Table 1.

[75128] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2171 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2171 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75129] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2171 gene, herein designated VGAM is

inhibition of expression of VGAM2171 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2171 correlate with, and may be deduced from, the identity of the target genes which VGAM2171 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75130] Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM_045786) is a VGAM2171 host target gene. CIT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIT BINDING SITE, designated SEQ ID:34559, to the nucleotide sequence of VGAM2171 RNA, herein designated VGAM RNA, also designated SEQ ID:4882.

[75131] A function of VGAM2171 is therefore inhibition of Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM_045786), a gene which is increased several-fold by coexpression of constitutively active Rho . Accordingly, utilities of VGAM2171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIT. The function of CIT and its association with vari-

ous diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM393.KIAA0475 (Accession NM_014864) is another VGAM2171 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16944, to the nucleotide sequence of VGAM2171 RNA, herein designated VGAM RNA, also designated SEQ ID:4882.

[75132] Another function of VGAM2171 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM2171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. KIAA1649 (Accession NM_032311) is another VGAM2171 host target gene. KIAA1649 BINDING SITE1 and KIAA1649 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1649, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of KIAA1649 BINDING SITE1 and KIAA1649 BINDING SITE2, designated SEQ ID:26100 and SEQ ID:33254 respectively, to the nucleotide sequence of VGAM2171 RNA, herein designated VGAM RNA, also designated SEQ ID:4882.

[75133] Another function of VGAM2171 is therefore inhibition of KIAA1649 (Accession NM_032311). Accordingly, utilities of VGAM2171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. TUSP (Accession NM_020245) is another VGAM2171 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21520, to the nucleotide sequence of VGAM2171 RNA, herein designated VGAM RNA, also designated SEQ ID:4882.

[75134] Another function of VGAM2171 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM2171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP.

Zinc Finger Protein 384 (ZNF384, Accession NM_133476) is another VGAM2171 host target gene. ZNF384 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF384, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF384 BINDING SITE, designated SEQ ID:28544, to the nucleotide sequence of VGAM2171 RNA, herein designated VGAM RNA, also designated SEQ ID:4882.

[75135] Another function of VGAM2171 is therefore inhibition of Zinc Finger Protein 384 (ZNF384, Accession NM_133476). Accordingly, utilities of VGAM2171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF384. LOC221656 (Accession XM_166418) is another VGAM2171 host target gene. LOC221656 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221656 BINDING SITE, designated SEQ ID:44290, to the nucleotide sequence of

VGAM2171 RNA, herein designated VGAM RNA, also designated SEQ ID:4882.

[75136] Another function of VGAM2171 is therefore inhibition of LOC221656 (Accession XM_166418). Accordingly, utilities of VGAM2171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221656. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2172 (VGAM2172) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75137] VGAM2172 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2172 was detected is described hereinabove with reference to Figs. 1-8.

[75138] VGAM2172 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip Yellow Fleck Virus. VGAM2172 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75139] VGAM2172 gene encodes a VGAM2172 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2172 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2172 precursor RNA is designated SEQ ID:2158, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2158 is located at position 578 relative to the genome of Parsnip Yellow Fleck Virus.

[75140] VGAM2172 precursor RNA folds onto itself, forming VGAM2172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75141] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2172 folded precursor RNA into VGAM2172 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2172 RNA is designated SEQ ID:4883, and is provided hereinbelow with reference to the sequence listing part.

[75142] VGAM2172 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2172 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2172 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75143] VGAM2172 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2172 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2172 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2172 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2172 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75144] The complementary binding of VGAM2172 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2172 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2172 host target RNA into VGAM2172 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75145] It is appreciated that VGAM2172 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2172 host target genes. The mRNA of each one of this plurality of VGAM2172 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2172 RNA, herein designated VGAM RNA, and which when bound by VGAM2172 RNA causes inhibition of translation of respective one or more VGAM2172 host target proteins.

[75146] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2172 gene, herein designated VGAM GENE, on one or more VGAM2172 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75147] It is yet further appreciated that a function of VGAM2172 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2172 include diagnosis, prevention and treatment of viral infection by Parsnip Yellow Fleck Virus. Specific functions, and accordingly utilities, of VGAM2172 correlate with, and may be deduced from, the identity of the host target genes which VGAM2172 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75148] Nucleotide sequences of the VGAM2172 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2172 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2172 are further described hereinbelow with reference to Table 1.

[75149] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2172 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2172 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75150] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2172 gene, herein designated VGAM is inhibition of expression of VGAM2172 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2172 correlate with, and may be deduced from, the identity of the target genes which VGAM2172 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75151] Aldehyde Dehydrogenase 3 Family, Member A2 (ALDH3A2, Accession XM_045060) is a VGAM2172 host target gene. ALDH3A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALDH3A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH3A2 BINDING SITE, designated SEQ ID:34338, to the nucleotide sequence of VGAM2172 RNA, herein designated VGAM RNA, also designated SEQ ID:4883.

[75152] A function of VGAM2172 is therefore inhibition of Alde-

hyde Dehydrogenase 3 Family, Member A2 (ALDH3A2, Accession XM_045060). Accordingly, utilities of VGAM2172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH3A2. Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006) is another VGAM2172 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:7730, to the nucleotide sequence of VGAM2172 RNA, herein designated VGAM RNA, also designated SEQ ID:4883.

[75153] Another function of VGAM2172 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM2172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM51.Heterogeneous Nuclear Ribonucleoprotein K (HNRPK, Accession NM_002140) is another VGAM2172 host target gene. HNRPK BINDING SITE1 and HNRPK BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HNRPK, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPK BINDING SITE1 and HNRPK BINDING SITE2, designated SEQ ID:7917 and SEQ ID:25281 respectively, to the nucleotide sequence of VGAM2172 RNA, herein designated VGAM RNA, also designated SEQ ID:4883.

[75154] Another function of VGAM2172 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein K (HNRPK, Accession NM_002140), a gene which play a role in the nuclear metabolism of hnrnas, particularly for pre-mrnas that contain cytidine-rich sequence. Accordingly, utilities of VGAM2172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPK. The function of HNRPK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125.Peanut-like 2 (Drosophila)

(PNUTL2, Accession NM_080415) is another VGAM2172 host target gene. PNUTL2 BINDING SITE1 and PNUTL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PNUTL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNUTL2 BINDING SITE1 and PNUTL2 BINDING SITE2, designated SEQ ID:27833 and SEQ ID:23131 respectively, to the nucleotide sequence of VGAM2172 RNA, herein designated VGAM RNA, also designated SEQ ID:4883.

[75155] Another function of VGAM2172 is therefore inhibition of Peanut-like 2 (Drosophila) (PNUTL2, Accession NM_080415), a gene which is involved in cytokinesis. Accordingly, utilities of VGAM2172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNUTL2. The function of PNUTL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.KIAA1054 (Accession XM_043493) is another VGAM2172 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:33959, to the nucleotide sequence of VGAM2172 RNA, herein designated VGAM RNA, also designated SEQ ID:4883.

[75156] Another function of VGAM2172 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM2172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. KIAA1677 (Accession XM_040383) is another VGAM2172 host target gene. KIAA1677 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1677 BINDING SITE, designated SEQ ID:33292, to the nucleotide sequence of VGAM2172 RNA, herein designated VGAM RNA, also designated SEQ ID:4883.

[75157] Another function of VGAM2172 is therefore inhibition of KIAA1677 (Accession XM_040383). Accordingly, utilities

of VGAM2172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1677. LOC148946 (Accession XM_097557) is another VGAM2172 host target gene. LOC148946 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148946 BINDING SITE, designated SEQ ID:40935, to the nucleotide sequence of VGAM2172 RNA, herein designated VGAM RNA, also designated SEQ ID:4883.

[75158] Another function of VGAM2172 is therefore inhibition of LOC148946 (Accession XM_097557). Accordingly, utilities of VGAM2172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148946. LOC161829 (Accession XM_091161) is another VGAM2172 host target gene. LOC161829 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC161829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC161829 BINDING SITE, designated SEQ ID:40039, to the nucleotide sequence of VGAM2172 RNA, herein designated VGAM RNA, also designated SEQ ID:4883.

[75159] Another function of VGAM2172 is therefore inhibition of LOC161829 (Accession XM_091161). Accordingly, utilities of VGAM2172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161829. LOC219333 (Accession XM_167944) is another VGAM2172 host target gene. LOC219333 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219333 BINDING SITE, designated SEQ ID:44935, to the nucleotide sequence of VGAM2172 RNA, herein designated VGAM RNA, also designated SEQ ID:4883.

[75160] Another function of VGAM2172 is therefore inhibition of LOC219333 (Accession XM_167944). Accordingly, utilities of VGAM2172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2173 (VGAM2173) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75161] VGAM2173 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2173 was detected is described hereinabove with reference to Figs. 1-8.

[75162] VGAM2173 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip Yellow Fleck Virus. VGAM2173 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75163] VGAM2173 gene encodes a VGAM2173 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2173 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2173 precursor RNA is designated SEQ ID:2159, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2159 is located at position 3661 relative to the

genome of Parsnip Yellow Fleck Virus.

[75164] VGAM2173 precursor RNA folds onto itself, forming VGAM2173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75165] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2173 folded precursor RNA into VGAM2173 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM2173 RNA is designated SEQ ID:4884, and is provided hereinbelow with reference to the sequence listing part.

[75166] VGAM2173 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2173 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2173 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75167] VGAM2173 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2173 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2173 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2173 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2173 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75168] The complementary binding of VGAM2173 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2173 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2173 host target RNA into VGAM2173 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75169] It is appreciated that VGAM2173 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2173 host target genes. The mRNA of each one of this plurality of VGAM2173 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2173 RNA, herein designated VGAM RNA, and which when bound by VGAM2173 RNA causes inhibition of translation of respective one or more VGAM2173 host target proteins.

[75170] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2173 gene, herein designated VGAM GENE, on one or more VGAM2173 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75171] It is yet further appreciated that a function of VGAM2173 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of viral infection by Parsnip Yellow Fleck Virus. Specific functions, and accordingly utilities, of VGAM2173

correlate with, and may be deduced from, the identity of the host target genes which VGAM2173 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75172] Nucleotide sequences of the VGAM2173 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2173 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2173 are further described hereinbelow with reference to Table 1.

[75173] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2173 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2173 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75174] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2173 gene, herein designated VGAM is inhibition of expression of VGAM2173 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2173 correlate with, and may be deduced

from, the identity of the target genes which VGAM2173 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75175] Calcium Channel, Voltage-dependent, Gamma Subunit 3 (CACNG3, Accession NM_006539) is a VGAM2173 host target gene. CACNG3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CACNG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNG3 BINDING SITE, designated SEQ ID:13291, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75176] A function of VGAM2173 is therefore inhibition of Calcium Channel, Voltage-dependent, Gamma Subunit 3 (CACNG3, Accession NM_006539), a gene which is thought to stabilize the calcium channel in an inactivated state. Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG3. The function of CACNG3 and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

inabove with reference to VGAM1551.Collagen, Type XI, Alpha 2 (COL11A2, Accession NM_080680) is another VGAM2173 host target gene. COL11A2 BINDING SITE1 and COL11A2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL11A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL11A2 BINDING SITE1 and COL11A2 BINDING SITE2, designated SEQ ID:27977 and SEQ ID:27982 respectively, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75177] Another function of VGAM2173 is therefore inhibition of Collagen, Type XI, Alpha 2 (COL11A2, Accession NM_080680). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2. Hypoxia Up-regulated 1 (HYOU1, Accession XM_006464) is another VGAM2173 host target gene. HYOU1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HYOU1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HYOU1 BINDING SITE, designated SEQ ID:30002, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75178] Another function of VGAM2173 is therefore inhibition of Hypoxia Up-regulated 1 (HYOU1, Accession XM_006464). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYOU1. Megakaryocyte-associated Tyrosine Kinase (MATK, Accession NM_002378) is another VGAM2173 host target gene. MATK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MATK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MATK BINDING SITE, designated SEQ ID:8193, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75179] Another function of VGAM2173 is therefore inhibition of Megakaryocyte-associated Tyrosine Kinase (MATK, Accession NM_002378), a gene which can phosphorylate mem-

bers of the SRC family of PTKs at the regulatory tyrosine residue. Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MATK. The function of MATK has been established by previous studies. In the mouse, Klages et al. (1994) reported the molecular cloning and preliminary functional characterization of a nonreceptor protein tyrosine kinase (PTK) that is related to CSK (OMIM Ref. No. 124095). This PTK, designated Ctk for CSK-type protein-tyrosine kinase, was found to be a 52-kD protein expressed primarily in brain and predicted to be structurally similar to CSK. Klages et al. (1994) found that, like CSK, Ctk can phosphorylate members of the SRC family of PTKs at the regulatory tyrosine residue. Thus, Ctk and CSK define a family of kinases that phosphorylate carboxy-terminal regulatory tyrosine residues. Protein-tyrosine kinases play major roles in signal transduction pathways. Bennett et al. (1994) cloned a novel tyrosine kinase, termed megakaryoctye-associated tyrosine kinase (MATK), from a human megakaryocyte cDNA library using degenerate PCR. The MATK cDNA encodes a 527-amino acid protein that shows 50% amino acid identity to CSK and has the structural features of the CSK subfamily: SRC homol-

ogy SH (2) and SH3 domains, a catalytic domain, a unique N terminus, lack of myristylation signals, lack of a negative regulatory phosphorylation site, and lack of an autophosphorylation site. Bennett et al. (1994) localized the MATK protein to the cytoplasm of megakaryocytic cells using immunofluorescence and immunoblot analysis of subcellular fractions. They showed by Northern blotting that the MATK gene is expressed abundantly in megakaryocytes and at a lower level in adult brain as a 2.3-kb transcript; it was not detectably expressed in any other examined tissue. Bennett et al. (1994) found that MATK expression is upregulated in megakaryocytic cells that are induced to differentiate by phorbol ester. They suggested that MATK functions in signal transduction pathways that are important in megakaryocyte growth and/or differentiation. Avraham et al. (1995) showed that MATK can phosphorylate the SRC (OMIM Ref. No. 176947) protein in vitro. Sakano et al. (1994) cloned the MATK cDNA, named HYL by them, and localized the gene to 19p13.3 using fluorescence in situ hybridization. Avraham et al. (1995) mapped the MATK gene to chromosome 19 using somatic cell hybrids and found that the murine Matk gene maps within a region of synteny on chromosome 10.

Zrihan-Licht et al. (1997) reported that MATK is expressed in human breast cancer but not in the adjacent normal breast tissues, suggesting that MATK might be involved in signaling in some cases of breast cancer. Zrihan-Licht et al. (1997) demonstrated that MATK interacts with ErbB-2 (OMIM Ref. No. 164870) in vivo upon heregulin stimulation and that this interaction occurs via the SH2 domain of MATK.

[75183] Further studies establishing the function and utilities of MATK are found in John Hopkins OMIM database record ID 600038, and in sited publications numbered 8119-8123 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference.Paired Box Gene 5 (B-cell lineage specific activator protein) (PAX5, Accession NM_016734) is another VGAM2173 host target gene. PAX5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAX5 BINDING SITE, designated SEQ ID:18788, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75184] Another function of VGAM2173 is therefore inhibition of Paired Box Gene 5 (B-cell lineage specific activator protein) (PAX5, Accession NM_016734), a gene which plays a role in B-cell differentiation, neural development and spermatogenesis. Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX5. The function of PAX5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151.Prokineticin 1 (PROK1, Accession NM_032414) is another VGAM2173 host target gene. PROK1 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PROK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROK1 BINDING SITE, designated SEQ ID:26196, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75185] Another function of VGAM2173 is therefore inhibition of Prokineticin 1 (PROK1, Accession NM_032414), a gene which induces proliferation, migration and fenestration in capillary endothelial cells derived from endocrine glands. Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROK1. The function of PROK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1000.Transcription Factor 3 (E2A immunoglobulin enhancer binding factors E12/E47) (TCF3, Accession XM_047600) is another VGAM2173 host target gene. TCF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TCF3, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF3 BINDING SITE, designated SEQ ID:35004, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75186] Another function of VGAM2173 is therefore inhibition of Transcription Factor 3 (E2A immunoglobulin enhancer binding factors E12/E47) (TCF3, Accession XM_047600), a gene which plays major roles in determining tissue-specific cell fate during embryogenesis. Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF3. The function of TCF3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144.XT3 (Accession NM_020208) is another VGAM2173 host target gene. XT3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XT3 BINDING SITE, desig-

nated SEQ ID:21437, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75187] Another function of VGAM2173 is therefore inhibition of XT3 (Accession NM_020208), a gene which is a Kidney-specific orphan transporter. Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XT3. The function of XT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM21.Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM_004536) is another VGAM2173 host target gene. BIRC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC1 BINDING SITE, designated SEQ ID:10879, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75188] Another function of VGAM2173 is therefore inhibition of Baculoviral IAP Repeat-containing 1 (BIRC1, Accession

NM_004536). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC1. Chemokine (C-C motif) Receptor 5 (CCR5, Accession NM_000579) is another VGAM2173 host target gene. CCR5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR5 BINDING SITE, designated SEQ ID:6181, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75189] Another function of VGAM2173 is therefore inhibition of Chemokine (C-C motif) Receptor 5 (CCR5, Accession NM_000579). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR5. DKFZP564D166 (Accession NM_030658) is another VGAM2173 host target gene. DKFZP564D166 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564D166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D166 BINDING SITE, designated SEQ ID:24988, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75190] Another function of VGAM2173 is therefore inhibition of DKFZP564D166 (Accession NM_030658). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D166. FLJ20400 (Accession XM_039306) is another VGAM2173 host target gene. FLJ20400 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20400, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20400 BINDING SITE, designated SEQ ID:33043, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75191] Another function of VGAM2173 is therefore inhibition of FLJ20400 (Accession XM_039306). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20400. KIAA0193 (Accession NM_014766) is another VGAM2173 host target gene. KIAA0193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:16537, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75192] Another function of VGAM2173 is therefore inhibition of KIAA0193 (Accession NM_014766). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193. KIAA0648 (Accession XM_094043) is another VGAM2173 host target gene. KIAA0648 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0648, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0648 BINDING SITE, designated SEQ ID:40218, to the nucleotide sequence of VGAM2173 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4884.

[75193] Another function of VGAM2173 is therefore inhibition of KIAA0648 (Accession XM_094043). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0648. KIAA0903 (Accession XM_049251) is another VGAM2173 host target gene. KIAA0903 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0903 BINDING SITE, designated SEQ ID:35366, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75194] Another function of VGAM2173 is therefore inhibition of KIAA0903 (Accession XM_049251). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0903. KIAA1037 (Accession NM_015023) is another VGAM2173 host target gene. KIAA1037 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1037, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1037 BINDING SITE, designated SEQ ID:17384, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75195] Another function of VGAM2173 is therefore inhibition of KIAA1037 (Accession NM_015023). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1037. KIAA1786 (Accession XM_038436) is another VGAM2173 host target gene. KIAA1786 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1786 BINDING SITE, designated SEQ ID:32844, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75196] Another function of VGAM2173 is therefore inhibition of KIAA1786 (Accession XM_038436). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1786. NSE1 (Accession NM_145175) is another VGAM2173 host target gene. NSE1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NSE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NSE1 BINDING SITE, designated SEQ ID:29736, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75197] Another function of VGAM2173 is therefore inhibition of NSE1 (Accession NM_145175). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NSE1. P450RAI-2 (Accession NM_019885) is another VGAM2173 host target gene. P450RAI-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P450RAI-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P450RAI-2 BINDING SITE, designated SEQ ID:21269, to the nucleotide se-

quence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75198] Another function of VGAM2173 is therefore inhibition of P450RAI-2 (Accession NM_019885). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P450RAI-2. Protein Serine Kinase H1 (PSKH1, Accession XM_043047) is another VGAM2173 host target gene. PSKH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSKH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSKH1 BINDING SITE, designated SEQ ID:33866, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75199] Another function of VGAM2173 is therefore inhibition of Protein Serine Kinase H1 (PSKH1, Accession XM_043047). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSKH1. RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733) is another

VGAM2173 host target gene. RAB40A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAB40A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40A BINDING SITE, designated SEQ ID:39927, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75200] Another function of VGAM2173 is therefore inhibition of RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40A. Rho-related BTB Domain Containing 2 (RHOBTB2, Accession XM_027679) is another VGAM2173 host target gene. RHOBTB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RHOBTB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB2 BINDING SITE, designated SEQ ID:30557, to the nucleotide sequence of VGAM2173 RNA,

herein designated VGAM RNA, also designated SEQ ID:4884.

[75201] Another function of VGAM2173 is therefore inhibition of Rho-related BTB Domain Containing 2 (RHOBTB2, Accession XM_027679). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB2. SEC15B (Accession XM_039570) is another VGAM2173 host target gene. SEC15B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC15B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC15B BINDING SITE, designated SEQ ID:33123, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75202] Another function of VGAM2173 is therefore inhibition of SEC15B (Accession XM_039570). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC15B. WD Repeat Domain 7 (WDR7, Accession NM_015285) is another VGAM2173 host target gene.

WDR7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WDR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR7 BINDING SITE, designated SEQ ID:17607, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75203] Another function of VGAM2173 is therefore inhibition of WD Repeat Domain 7 (WDR7, Accession NM_015285). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR7. LOC144558 (Accession XM_096629) is another VGAM2173 host target gene. LOC144558 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144558 BINDING SITE, designated SEQ ID:40436, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75204] Another function of VGAM2173 is therefore inhibition of LOC144558 (Accession XM_096629). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144558. LOC153196 (Accession XM_098323) is another VGAM2173 host target gene. LOC153196 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, designated SEQ ID:41584, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75205] Another function of VGAM2173 is therefore inhibition of LOC153196 (Accession XM_098323). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153196. LOC219731 (Accession XM_167596) is another VGAM2173 host target gene. LOC219731 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219731, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219731 BINDING SITE, designated SEQ ID:44714, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75206] Another function of VGAM2173 is therefore inhibition of LOC219731 (Accession XM_167596). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219731. LOC91759 (Accession XM_040467) is another VGAM2173 host target gene. LOC91759 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91759 BINDING SITE, designated SEQ ID:33302, to the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, also designated SEQ ID:4884.

[75207] Another function of VGAM2173 is therefore inhibition of LOC91759 (Accession XM_040467). Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91759. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2174 (VGAM2174) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75208] VGAM2174 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2174 was detected is described hereinabove with reference to Figs. 1-8.

[75209] VGAM2174 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM2174 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75210] VGAM2174 gene encodes a VGAM2174 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2174 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2174 precursor RNA is designated SEQ ID:2160, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2160 is located at position 17511 relative to the genome of Rabbit Fibroma Virus.

[75211] VGAM2174 precursor RNA folds onto itself, forming VGAM2174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75212] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2174 folded precursor RNA into VGAM2174 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM2174 RNA is designated SEQ ID:4885, and is provided hereinbelow with reference to the sequence listing part.

[75213] VGAM2174 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2174 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2174 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75214] VGAM2174 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2174 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2174 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2174 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2174 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75215] The complementary binding of VGAM2174 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2174 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2174 host target RNA into VGAM2174 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75216] It is appreciated that VGAM2174 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2174 host target genes. The mRNA of each one of this plurality of VGAM2174 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2174 RNA, herein designated VGAM RNA, and which when bound by VGAM2174 RNA causes

inhibition of translation of respective one or more VGAM2174 host target proteins.

[75217] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2174 gene, herein designated VGAM GENE, on one or more VGAM2174 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75218] It is yet further appreciated that a function of VGAM2174 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2174 include diagnosis, prevention and

treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM2174 correlate with, and may be deduced from, the identity of the host target genes which VGAM2174 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75219] Nucleotide sequences of the VGAM2174 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2174 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2174 are further described hereinbelow with reference to Table 1.

[75220] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2174 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2174 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75221] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2174 gene, herein designated VGAM is inhibition of expression of VGAM2174 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2174 correlate with, and may be deduced from, the identity of the target genes which VGAM2174 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75222] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM_004776) is a VGAM2174 host target gene. B4GALT5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by B4GALT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT5 BINDING SITE, designated SEQ ID:11166, to the nucleotide sequence of VGAM2174 RNA, herein designated VGAM RNA, also designated SEQ ID:4885.

[75223] A function of VGAM2174 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM_004776). Accordingly, utilities of VGAM2174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT5. Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM_133631) is

another VGAM2174 host target gene. ROBO1 BINDING SITE1 and ROBO1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ROBO1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO1 BINDING SITE1 and ROBO1 BINDING SITE2, designated SEQ ID:28586 and SEQ ID:8850 respectively, to the nucleotide sequence of VGAM2174 RNA, herein designated VGAM RNA, also designated SEQ ID:4885.

[75224] Another function of VGAM2174 is therefore inhibition of Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM_133631), a gene which is an axon guidance receptor. Accordingly, utilities of VGAM2174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO1. The function of ROBO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM37.KIAA0276 (Accession XM_048199) is another VGAM2174 host target gene. KIAA0276 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by KIAA0276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0276 BINDING SITE, designated SEQ ID:35139, to the nucleotide sequence of VGAM2174 RNA, herein designated VGAM RNA, also designated SEQ ID:4885.

[75225] Another function of VGAM2174 is therefore inhibition of KIAA0276 (Accession XM_048199). Accordingly, utilities of VGAM2174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0276. KIAA0976 (Accession NM_014917) is another VGAM2174 host target gene. KIAA0976 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0976 BINDING SITE, designated SEQ ID:17163, to the nucleotide sequence of VGAM2174 RNA, herein designated VGAM RNA, also designated SEQ ID:4885.

[75226] Another function of VGAM2174 is therefore inhibition of KIAA0976 (Accession NM_014917). Accordingly, utilities

of VGAM2174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0976. PRO0618 (Accession NM_014133) is another VGAM2174 host target gene. PRO0618 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO0618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0618 BINDING SITE, designated SEQ ID:15399, to the nucleotide sequence of VGAM2174 RNA, herein designated VGAM RNA, also designated SEQ ID:4885.

[75227] Another function of VGAM2174 is therefore inhibition of PRO0618 (Accession NM_014133). Accordingly, utilities of VGAM2174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0618. LOC90092 (Accession XM_028862) is another VGAM2174 host target gene. LOC90092 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90092 BINDING SITE, designated SEQ ID:30783, to the nucleotide sequence of VGAM2174 RNA, herein designated VGAM RNA, also designated SEQ ID:4885.

[75228] Another function of VGAM2174 is therefore inhibition of LOC90092 (Accession XM_028862). Accordingly, utilities of VGAM2174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90092. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2175 (VGAM2175) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75229] VGAM2175 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2175 was detected is described hereinabove with reference to Figs. 1-8.

[75230] VGAM2175 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM2175 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75231] VGAM2175 gene encodes a VGAM2175 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2175 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2175 precursor RNA is designated SEQ ID:2161, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2161 is located at position 10893 relative to the genome of Rabbit Fibroma Virus.

[75232] VGAM2175 precursor RNA folds onto itself, forming VGAM2175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75233] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2175 folded precursor RNA into VGAM2175 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM2175 RNA is designated SEQ ID:4886, and is provided hereinbelow with reference to the sequence listing part.

[75234] VGAM2175 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2175 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2175 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75235] VGAM2175 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2175 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2175 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2175 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2175 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75236] The complementary binding of VGAM2175 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2175 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2175 host target RNA into VGAM2175 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75237] It is appreciated that VGAM2175 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2175 host target genes. The mRNA of each one of this plurality of VGAM2175 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2175 RNA, herein designated VGAM RNA, and which when bound by VGAM2175 RNA causes inhibition of translation of respective one or more VGAM2175 host target proteins.

[75238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2175 gene, herein designated VGAM GENE, on one or more VGAM2175 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75239] It is yet further appreciated that a function of VGAM2175 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2175 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM2175 correlate with, and may be deduced from, the identity of the host target genes which VGAM2175 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75240] Nucleotide sequences of the VGAM2175 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2175 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2175 are further described hereinbelow with reference to Table 1.

[75241] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2175 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2175 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75242] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2175 gene, herein designated VGAM is inhibition of expression of VGAM2175 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2175 correlate with, and may be deduced from, the identity of the target genes which VGAM2175 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75243] ATPase, Class VI, Type 11B (ATP11B, Accession XM_087254) is a VGAM2175 host target gene. ATP11B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11B BINDING SITE, designated SEQ ID:39142, to the nucleotide sequence of VGAM2175 RNA, herein designated VGAM RNA, also designated SEQ ID:4886.

[75244] A function of VGAM2175 is therefore inhibition of ATPase,

Class VI, Type 11B (ATP11B, Accession XM_087254), a gene which is phosphorylated in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of VGAM2175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11B. The function of ATP11B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665.Egl Nine Homolog 3 (C. elegans) (EGLN3, Accession NM_022073) is another VGAM2175 host target gene. EGLN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EGLN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN3 BINDING SITE, designated SEQ ID:22616, to the nucleotide sequence of VGAM2175 RNA, herein designated VGAM RNA, also designated SEQ ID:4886.

[75245] Another function of VGAM2175 is therefore inhibition of Egl Nine Homolog 3 (C. elegans) (EGLN3, Accession NM_022073), a gene which is an essential component of the pathway. Accordingly, utilities of VGAM2175 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN3. The function of EGLN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM_056815) is another VGAM2175 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36433, to the nucleotide sequence of VGAM2175 RNA, herein designated VGAM RNA, also designated SEQ ID:4886.

[75246] Another function of VGAM2175 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM_056815), a gene which has similarity to Drosophila dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM2175 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180.Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM_133631) is another VGAM2175 host target gene. ROBO1 BINDING SITE1 and ROBO1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ROBO1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO1 BINDING SITE1 and ROBO1 BINDING SITE2, designated SEQ ID:28587 and SEQ ID:8851 respectively, to the nucleotide sequence of VGAM2175 RNA, herein designated VGAM RNA, also designated SEQ ID:4886.

[75247] Another function of VGAM2175 is therefore inhibition of Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM_133631), a gene which is an axon guidance receptor. Accordingly, utilities of VGAM2175 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with ROBO1. The function of ROBO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM37.Transcription Termination Factor, RNA Polymerase II (TTF2, Accession NM_003594) is another VGAM2175 host target gene. TTF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TTF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTF2 BINDING SITE, designated SEQ ID:9652, to the nucleotide sequence of VGAM2175 RNA, herein designated VGAM RNA, also designated SEQ ID:4886.

[75248] Another function of VGAM2175 is therefore inhibition of Transcription Termination Factor, RNA Polymerase II (TTF2, Accession NM_003594), a gene which is involved either in promoting the migration process or in repressing differentiation of the TFCs until migration has occurred. Accordingly, utilities of VGAM2175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTF2. The function of TTF2 has been

established by previous studies. Clifton-Bligh et al. (1998) demonstrated that the FKHL15 gene, which is the human homolog of the mouse Titf2 gene, was homozygously mutated in 2 sibs with thyroid agenesis, cleft palate, and choanal atresia, previously reported by Bamforth et al. (1989); see Bamforth-Lazarus syndrome (OMIM Ref. No. 241850). Spiky or curly hair was also a feature, as was bifid epiglottis. Polyhydramnios, which was present in the 2 pregnancies of the brothers and in another reported case of Bamforth-Lazarus syndrome, may have been caused by the choanal atresia. Clifton-Bligh et al. (1998) had found by a database search against the rat TTF2 gene more than 90% homology with FKHL15. The FKHL15 cDNA was encoded by a single-exon gene. A probe specific to the 3-prime UTR of FKHL15 detected a 5.3-kb transcript that was highly expressed in thyroid tissues, and a second 3.2-kb transcript seen in both thyroid and testis. Animal model experiments lend further support to the function of TTF2. Many members of the forkhead/winged-helix transcription factor family are key regulators of embryogenesis (Kaufmann and Knochel, 1996). Thyroid transcription factor-2 (TTF2), a forkhead domain-containing transcription factor, was cloned by Zannini et al. (1997) and the

mouse gene, designated Titf2, was mapped to chromosome 4. De Felice et al. (1998) showed that Titf2-null mutant mice exhibit cleft palate and either a sublingual or completely absent thyroid gland. Thus, the Titf2-/- mutation results in neonatal hypothyroidism that showed similarity to thyroid dysgenesis in humans. Among the 1 in 3,000 or 4,000 newborns in which congenital hypothyroidism is detected, 80% have either an ectopic, small and sublingual thyroid, or have no thyroid tissue (Toublanc, 1992). Most of these cases appear sporadically, although a few cases of recurring familial thyroid dysgenesis (OMIM Ref. No. 218700) have been reported.

[75249] It is appreciated that the abovementioned animal model for TTF2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[75250] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[75251] Clifton-Bligh, R. J.; Wentworth, J. M.; Heinz, P.; Crisp, M. S.; John, R.; Lazarus, J. H.; Ludgate, M.; Chatterjee, V. K. : Mutation of the gene encoding human TTF-2 associated with thyroid agenesis, cleft palate and choanal atresia.

Nature Genet. 19: 399-401, 1998. ; and

[75252] De Felice, M.; Ovitt, C.; Biffali, E.; Rodriguez-Mallon, A.; Arra, C.; Anastassiadis, K.; Macchia, P. E.; Mattei, M.-G.; Mariano, A.; Scholer, H.; Macchia, V.; Di Lauro, R. : A mouse model.

[75253] Further studies establishing the function and utilities of TTF2 are found in John Hopkins OMIM database record ID 602617, and in sited publications numbered 943 and 12372-8462 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Dynactin 4 (p62) (DCTN4, Accession XM_041993) is another VGAM2175 host target gene. DCTN4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCTN4 BINDING SITE, designated SEQ ID:33663, to the nucleotide sequence of VGAM2175 RNA, herein designated VGAM RNA, also designated SEQ ID:4886.

[75254] Another function of VGAM2175 is therefore inhibition of Dynactin 4 (p62) (DCTN4, Accession XM_041993). Accordingly, utilities of VGAM2175 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with DCTN4. FLJ00001 (Accession XM_088525) is another VGAM2175 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39773, to the nucleotide sequence of VGAM2175 RNA, herein designated VGAM RNA, also designated SEQ ID:4886.

[75255] Another function of VGAM2175 is therefore inhibition of FLJ00001 (Accession XM_088525). Accordingly, utilities of VGAM2175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. LOC131308 (Accession XM_059501) is another VGAM2175 host target gene. LOC131308 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC131308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131308 BINDING SITE, designated SEQ ID:37012, to

the nucleotide sequence of VGAM2175 RNA, herein designated VGAM RNA, also designated SEQ ID:4886.

[75256] Another function of VGAM2175 is therefore inhibition of LOC131308 (Accession XM_059501). Accordingly, utilities of VGAM2175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131308. LOC257319 (Accession XM_171049) is another VGAM2175 host target gene. LOC257319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257319 BINDING SITE, designated SEQ ID:45830, to the nucleotide sequence of VGAM2175 RNA, herein designated VGAM RNA, also designated SEQ ID:4886.

[75257] Another function of VGAM2175 is therefore inhibition of LOC257319 (Accession XM_171049). Accordingly, utilities of VGAM2175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257319. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2176 (VGAM2176) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75258] VGAM2176 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2176 was detected is described hereinabove with reference to Figs. 1-8.

[75259] VGAM2176 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM2176 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75260] VGAM2176 gene encodes a VGAM2176 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2176 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2176 precursor RNA is designated SEQ ID:2162, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2162 is located at position 10073 relative to the genome of Rabbit Fibroma Virus.

[75261] VGAM2176 precursor RNA folds onto itself, forming VGAM2176 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75262] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2176 folded precursor RNA into VGAM2176 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2176 RNA is designated SEQ ID:4887, and is provided hereinbelow with reference to the sequence listing part.

[75263] VGAM2176 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2176 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2176 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75264] VGAM2176 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2176 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2176 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2176 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2176 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75265] The complementary binding of VGAM2176 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2176 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2176 host target RNA into VGAM2176 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75266] It is appreciated that VGAM2176 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2176 host target genes. The mRNA of each one of this plurality of VGAM2176 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2176 RNA, herein designated VGAM RNA, and which when bound by VGAM2176 RNA causes inhibition of translation of respective one or more VGAM2176 host target proteins.

[75267] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2176 gene, herein designated VGAM GENE, on one or more VGAM2176 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75268] It is yet further appreciated that a function of VGAM2176 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2176 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM2176 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2176 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75269] Nucleotide sequences of the VGAM2176 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2176 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2176 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2176 are further described hereinbelow with reference to Table 1.

[75270] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2176 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2176 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75271] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2176 gene, herein designated VGAM is inhibition of expression of VGAM2176 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2176 correlate with, and may be deduced from, the identity of the target genes which VGAM2176

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75272] FLJ00007 (Accession XM_048928) is a VGAM2176 host target gene. FLJ00007 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00007 BINDING SITE, designated SEQ ID:35315, to the nucleotide sequence of VGAM2176 RNA, herein designated VGAM RNA, also designated SEQ ID:4887.

[75273] A function of VGAM2176 is therefore inhibition of FLJ00007 (Accession XM_048928). Accordingly, utilities of VGAM2176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00007. FLJ20060 (Accession NM_017645) is another VGAM2176 host target gene. FLJ20060 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20060

BINDING SITE, designated SEQ ID:19148, to the nucleotide sequence of VGAM2176 RNA, herein designated VGAM RNA, also designated SEQ ID:4887.

[75274] Another function of VGAM2176 is therefore inhibition of FLJ20060 (Accession NM_017645). Accordingly, utilities of VGAM2176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20060. LOC91250 (Accession XM_037135) is another VGAM2176 host target gene. LOC91250 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91250, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91250 BINDING SITE, designated SEQ ID:32549, to the nucleotide sequence of VGAM2176 RNA, herein designated VGAM RNA, also designated SEQ ID:4887.

[75275] Another function of VGAM2176 is therefore inhibition of LOC91250 (Accession XM_037135). Accordingly, utilities of VGAM2176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91250. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2177 (VGAM2177) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75276] VGAM2177 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2177 was detected is described hereinabove with reference to Figs. 1-8.

[75277] VGAM2177 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM2177 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75278] VGAM2177 gene encodes a VGAM2177 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2177 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2177 precursor RNA is designated SEQ ID:2163, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2163 is located at position 14151 relative to the

genome of Rabbit Fibroma Virus.

[75279] VGAM2177 precursor RNA folds onto itself, forming VGAM2177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75280] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2177 folded precursor RNA into VGAM2177 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2177 RNA is designated SEQ ID:4888, and is provided hereinbelow with reference to the sequence listing part.

[75281] VGAM2177 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2177 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2177 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75282] VGAM2177 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2177 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2177 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2177 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2177 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75283] The complementary binding of VGAM2177 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2177 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2177 host target RNA into VGAM2177 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75284] It is appreciated that VGAM2177 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2177 host target genes. The mRNA of each one of this plurality of VGAM2177 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2177 RNA, herein designated VGAM RNA, and which when bound by VGAM2177 RNA causes inhibition of translation of respective one or more VGAM2177 host target proteins.

[75285] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2177 gene, herein designated VGAM GENE, on one or more VGAM2177 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75286] It is yet further appreciated that a function of VGAM2177 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2177 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM2177

correlate with, and may be deduced from, the identity of the host target genes which VGAM2177 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75287] Nucleotide sequences of the VGAM2177 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2177 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2177 are further described hereinbelow with reference to Table 1.

[75288] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2177 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2177 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75289] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2177 gene, herein designated VGAM is inhibition of expression of VGAM2177 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2177 correlate with, and may be deduced

from, the identity of the target genes which VGAM2177 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75290] Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223) is a VGAM2177 host target gene. ITPR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR2 BINDING SITE, designated SEQ ID:7990, to the nucleotide sequence of VGAM2177 RNA, herein designated VGAM RNA, also designated SEQ ID:4888.

[75291] A function of VGAM2177 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223). Accordingly, utilities of VGAM2177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR2. LOC151878 (Accession XM_087329) is another VGAM2177 host target gene. LOC151878 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151878, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151878 BINDING SITE, designated SEQ ID:39170, to the nucleotide sequence of VGAM2177 RNA, herein designated VGAM RNA, also designated SEQ ID:4888.

[75292] Another function of VGAM2177 is therefore inhibition of LOC151878 (Accession XM_087329). Accordingly, utilities of VGAM2177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151878. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2178 (VGAM2178) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75293] VGAM2178 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2178 was detected is described hereinabove with reference to Figs. 1-8.

[75294] VGAM2178 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM2178 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[75295] VGAM2178 gene encodes a VGAM2178 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2178 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2178 precursor RNA is designated SEQ ID:2164, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2164 is located at position 22881 relative to the genome of Rabbit Fibroma Virus.

[75296] VGAM2178 precursor RNA folds onto itself, forming VGAM2178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75297] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2178 folded precursor RNA into VGAM2178

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2178 RNA is designated SEQ ID:4889, and is provided hereinbelow with reference to the sequence listing part.

[75298] VGAM2178 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2178 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2178 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75299] VGAM2178 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2178 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2178 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2178 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2178 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75300] The complementary binding of VGAM2178 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2178 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2178 host target RNA into VGAM2178 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[75301] It is appreciated that VGAM2178 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2178 host target genes. The mRNA of each one of this plurality of VGAM2178 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2178 RNA, herein designated VGAM RNA, and which when bound by VGAM2178 RNA causes inhibition of translation of respective one or more VGAM2178 host target proteins.

[75302] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2178 gene, herein designated VGAM GENE, on one or more VGAM2178 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75303] It is yet further appreciated that a function of VGAM2178 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2178 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM2178 correlate with, and may be deduced from, the identity of the host target genes which VGAM2178 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75304] Nucleotide sequences of the VGAM2178 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2178 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2178 are further described hereinbelow with reference to Table 1.

[75305] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2178 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2178 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75306] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2178 gene, herein designated VGAM is inhibition of expression of VGAM2178 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2178 correlate with, and may be deduced from, the identity of the target genes which VGAM2178 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75307] Retinoblastoma Binding Protein 9 (RBBP9, Accession XM_046553) is a VGAM2178 host target gene. RBBP9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBBP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBBP9 BINDING SITE, designated SEQ ID:34745, to the nucleotide sequence of VGAM2178 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4889.

[75308] A function of VGAM2178 is therefore inhibition of Retinoblastoma Binding Protein 9 (RBBP9, Accession XM_046553). Accordingly, utilities of VGAM2178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP9. KIAA1056 (Accession NM_014894) is another VGAM2178 host target gene. KIAA1056 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1056 BINDING SITE, designated SEQ ID:17046, to the nucleotide sequence of VGAM2178 RNA, herein designated VGAM RNA, also designated SEQ ID:4889.

[75309] Another function of VGAM2178 is therefore inhibition of KIAA1056 (Accession NM_014894). Accordingly, utilities of VGAM2178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1056. KIAA1199 (Accession XM_051860) is another VGAM2178 host target gene. KIAA1199 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1199 BINDING SITE, designated SEQ ID:35898, to the nucleotide sequence of VGAM2178 RNA, herein designated VGAM RNA, also designated SEQ ID:4889.

[75310] Another function of VGAM2178 is therefore inhibition of KIAA1199 (Accession XM_051860). Accordingly, utilities of VGAM2178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1199. KIAA1458 (Accession XM_044434) is another VGAM2178 host target gene. KIAA1458 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1458, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1458 BINDING SITE, designated SEQ ID:34203, to the nucleotide sequence of VGAM2178 RNA, herein designated VGAM RNA, also designated SEQ ID:4889.

[75311] Another function of VGAM2178 is therefore inhibition of KIAA1458 (Accession XM_044434). Accordingly, utilities

of VGAM2178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1458. LOC151234 (Accession XM_087136) is another VGAM2178 host target gene. LOC151234 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151234, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151234 BINDING SITE, designated SEQ ID:39080, to the nucleotide sequence of VGAM2178 RNA, herein designated VGAM RNA, also designated SEQ ID:4889.

[75312] Another function of VGAM2178 is therefore inhibition of LOC151234 (Accession XM_087136). Accordingly, utilities of VGAM2178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151234. LOC257443 (Accession XM_171072) is another VGAM2178 host target gene. LOC257443 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC257443 BINDING SITE, designated SEQ ID:45872, to the nucleotide sequence of VGAM2178 RNA, herein designated VGAM RNA, also designated SEQ ID:4889.

[75313] Another function of VGAM2178 is therefore inhibition of LOC257443 (Accession XM_171072). Accordingly, utilities of VGAM2178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257443. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2179 (VGAM2179) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75314] VGAM2179 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2179 was detected is described hereinabove with reference to Figs. 1-8.

[75315] VGAM2179 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM2179 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75316] VGAM2179 gene encodes a VGAM2179 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2179 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2179 precursor RNA is designated SEQ ID:2165, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2165 is located at position 15205 relative to the genome of Rabbit Fibroma Virus.

[75317] VGAM2179 precursor RNA folds onto itself, forming VGAM2179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75318] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2179 folded precursor RNA into VGAM2179 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2179 RNA is designated SEQ ID:4890, and is provided hereinbelow with reference to the sequence listing part.

[75319] VGAM2179 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2179 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2179 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75320] VGAM2179 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2179 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2179 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2179 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2179 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75321] The complementary binding of VGAM2179 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2179 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2179 host target RNA into VGAM2179 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75322] It is appreciated that VGAM2179 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2179 host target genes. The mRNA of each one of this plurality of VGAM2179 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2179 RNA, herein designated VGAM RNA, and which when bound by VGAM2179 RNA causes inhibition of translation of respective one or more VGAM2179 host target proteins.

[75323] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2179 gene, herein designated VGAM GENE, on one or more VGAM2179 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75324] It is yet further appreciated that a function of VGAM2179 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2179 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM2179 correlate with, and may be deduced from, the identity of the host target genes which VGAM2179 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75325] Nucleotide sequences of the VGAM2179 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2179 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2179 are further described hereinbelow with reference to Table 1.

[75326] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2179 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2179 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75327] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2179 gene, herein designated VGAM is inhibition of expression of VGAM2179 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2179 correlate with, and may be deduced from, the identity of the target genes which VGAM2179 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75328] LOC158865 (Accession XM_099000) is a VGAM2179 host target gene. LOC158865 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158865 BINDING SITE, designated SEQ ID:42037, to the nucleotide sequence of VGAM2179 RNA, herein designated VGAM RNA, also designated SEQ ID:4890.

[75329] A function of VGAM2179 is therefore inhibition of

LOC158865 (Accession XM_099000). Accordingly, utilities of VGAM2179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158865. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2180 (VGAM2180) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75330] VGAM2180 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2180 was detected is described hereinabove with reference to Figs. 1-8.

[75331] VGAM2180 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM2180 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75332] VGAM2180 gene encodes a VGAM2180 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2180 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2180 precursor RNA is designated SEQ ID:2166, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2166 is located at position 128284 relative to the genome of Yaba-like Disease Virus.

[75333] VGAM2180 precursor RNA folds onto itself, forming VGAM2180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75334] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2180 folded precursor RNA into VGAM2180 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM2180 RNA is designated SEQ ID:4891, and is provided hereinbelow with reference to the sequence listing part.

[75335] VGAM2180 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2180 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2180 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75336] VGAM2180 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2180 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2180 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2180 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2180 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75337] The complementary binding of VGAM2180 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2180 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2180 host target RNA into VGAM2180 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75338] It is appreciated that VGAM2180 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2180 host target genes. The mRNA of each one of this plurality of VGAM2180 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2180 RNA, herein designated VGAM RNA, and which when bound by VGAM2180 RNA causes inhibition of translation of respective one or more VGAM2180 host target proteins.

[75339] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2180 gene, herein designated VGAM GENE, on one or more VGAM2180 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75340] It is yet further appreciated that a function of VGAM2180

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2180 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM2180 correlate with, and may be deduced from, the identity of the host target genes which VGAM2180 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75341] Nucleotide sequences of the VGAM2180 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2180 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2180 are further described hereinbelow with reference to Table 1.

[75342] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2180 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2180 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75343] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2180 gene, herein designated VGAM is inhibition of expression of VGAM2180 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2180 correlate with, and may be deduced from, the identity of the target genes which VGAM2180 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75344] Zinc Finger Protein 387 (ZNF387, Accession NM_014682) is a VGAM2180 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:16178, to the nucleotide sequence of VGAM2180 RNA, herein designated VGAM RNA, also designated SEQ ID:4891.

[75345] A function of VGAM2180 is therefore inhibition of Zinc Finger Protein 387 (ZNF387, Accession NM_014682). Accordingly, utilities of VGAM2180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF387. LOC157507 (Accession

XM_088312) is another VGAM2180 host target gene. LOC157507 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157507 BINDING SITE, designated SEQ ID:39603, to the nucleotide sequence of VGAM2180 RNA, herein designated VGAM RNA, also designated SEQ ID:4891.

[75346] Another function of VGAM2180 is therefore inhibition of LOC157507 (Accession XM_088312). Accordingly, utilities of VGAM2180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157507. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2181 (VGAM2181) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75347] VGAM2181 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2181 was detected is described hereinabove with reference to Figs. 1-8.

[75348] VGAM2181 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM2181 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75349] VGAM2181 gene encodes a VGAM2181 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2181 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2181 precursor RNA is designated SEQ ID:2167, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2167 is located at position 125843 relative to the genome of Yaba-like Disease Virus.

[75350] VGAM2181 precursor RNA folds onto itself, forming VGAM2181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75351] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2181 folded precursor RNA into VGAM2181 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2181 RNA is designated SEQ ID:4892, and is provided hereinbelow with reference to the sequence listing part.

[75352] VGAM2181 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2181 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2181 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75353] VGAM2181 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2181 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2181 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2181 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2181 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75354] The complementary binding of VGAM2181 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2181 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2181 host target RNA into VGAM2181 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75355] It is appreciated that VGAM2181 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2181 host target genes. The mRNA of each one of this plurality of VGAM2181 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2181 RNA, herein designated VGAM RNA, and which when bound by VGAM2181 RNA causes inhibition of translation of respective one or more VGAM2181 host target proteins.

[75356] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2181 gene, herein designated VGAM GENE, on one or more VGAM2181 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75357] It is yet further appreciated that a function of VGAM2181 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM2181 correlate with, and may be deduced from, the identity of the host target genes which VGAM2181 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75358] Nucleotide sequences of the VGAM2181 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2181 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2181 are further described hereinbelow with reference to Table 1.

[75359] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2181 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2181 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75360] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2181 gene, herein designated VGAM is inhibition of expression of VGAM2181 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2181 correlate with, and may be deduced from, the identity of the target genes which VGAM2181 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75361] Integrin, Alpha 1 (ITGA1, Accession XM_032902) is a VGAM2181 host target gene. ITGA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA1 BINDING SITE, designated SEQ ID:31790, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75362] A function of VGAM2181 is therefore inhibition of Integrin, Alpha 1 (ITGA1, Accession XM_032902). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA1. Pyruvate Dehydrogenase Kinase, Isoenzyme 4 (PDK4, Accession XM_173198) is another VGAM2181 host target gene. PDK4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDK4 BINDING SITE, designated SEQ ID:46440, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75363] Another function of VGAM2181 is therefore inhibition of Pyruvate Dehydrogenase Kinase, Isoenzyme 4 (PDK4, Ac-

cession XM_173198). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDK4. Podocalyxin-like (PODXL, Accession NM_005397) is another VGAM2181 host target gene. PODXL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PODXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PODXL BINDING SITE, designated SEQ ID:11875, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75364] Another function of VGAM2181 is therefore inhibition of Podocalyxin-like (PODXL, Accession NM_005397), a gene which is an antiadhesin. Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PODXL. The function of PODXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.Dual Specificity Phosphatase 10 (DUSP10, Accession NM_144729) is another VGAM2181 host target

gene. DUSP10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DUSP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP10 BINDING SITE, designated SEQ ID:29556, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75365] Another function of VGAM2181 is therefore inhibition of Dual Specificity Phosphatase 10 (DUSP10, Accession NM_144729). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP10. FLJ10342 (Accession NM_018064) is another VGAM2181 host target gene. FLJ10342 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10342 BINDING SITE, designated SEQ ID:19836, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ

ID:4892.

[75366] Another function of VGAM2181 is therefore inhibition of FLJ10342 (Accession NM_018064). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10342. FLJ11267 (Accession NM_019607) is another VGAM2181 host target gene. FLJ11267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11267 BINDING SITE, designated SEQ ID:21224, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75367] Another function of VGAM2181 is therefore inhibition of FLJ11267 (Accession NM_019607). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11267. FLJ13340 (Accession NM_057175) is another VGAM2181 host target gene. FLJ13340 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13340, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13340 BINDING SITE, designated SEQ ID:27706, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75368] Another function of VGAM2181 is therefore inhibition of FLJ13340 (Accession NM_057175). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13340. FLJ21777 (Accession NM_032209) is another VGAM2181 host target gene. FLJ21777 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ21777, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21777 BINDING SITE, designated SEQ ID:25923, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75369] Another function of VGAM2181 is therefore inhibition of FLJ21777 (Accession NM_032209). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ21777. FLJ23153 (Accession NM_024636) is another VGAM2181 host target gene. FLJ23153 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23153 BINDING SITE, designated SEQ ID:23907, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75370] Another function of VGAM2181 is therefore inhibition of FLJ23153 (Accession NM_024636). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23153. FLJ31978 (Accession NM_144669) is another VGAM2181 host target gene. FLJ31978 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ31978, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31978 BINDING SITE, designated SEQ ID:29488, to the nucleotide

sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75371] Another function of VGAM2181 is therefore inhibition of FLJ31978 (Accession NM_144669). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31978. Heat Shock 90kDa Protein 1, Alpha-like 3 (HSPCAL3, Accession XM_084514) is another VGAM2181 host target gene. HSPCAL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPCAL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPCAL3 BINDING SITE, designated SEQ ID:37615, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75372] Another function of VGAM2181 is therefore inhibition of Heat Shock 90kDa Protein 1, Alpha-like 3 (HSPCAL3, Accession XM_084514). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPCAL3. KIAA0276 (Accession XM_048199) is another VGAM2181

host target gene. KIAA0276 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0276 BINDING SITE, designated SEQ ID:35133, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75373] Another function of VGAM2181 is therefore inhibition of KIAA0276 (Accession XM_048199). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0276. TBDN100 (Accession NM_025085) is another VGAM2181 host target gene. TBDN100 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBDN100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBDN100 BINDING SITE, designated SEQ ID:24697, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75374] Another function of VGAM2181 is therefore inhibition of TBDN100 (Accession NM_025085). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBDN100. Thioesterase, Adipose Associated (THEA, Accession XM_038922) is another VGAM2181 host target gene. THEA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by THEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THEA BINDING SITE, designated SEQ ID:32944, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75375] Another function of VGAM2181 is therefore inhibition of Thioesterase, Adipose Associated (THEA, Accession XM_038922). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THEA. TUSP (Accession NM_020245) is another VGAM2181 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21519, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75376] Another function of VGAM2181 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. UBCE7IP5 (Accession NM_014948) is another VGAM2181 host target gene. UBCE7IP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBCE7IP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBCE7IP5 BINDING SITE, designated SEQ ID:17269, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75377] Another function of VGAM2181 is therefore inhibition of UBCE7IP5 (Accession NM_014948). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

UBCE7IP5. LOC143196 (Accession XM_096389) is another VGAM2181 host target gene. LOC143196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143196 BINDING SITE, designated SEQ ID:40329, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75378] Another function of VGAM2181 is therefore inhibition of LOC143196 (Accession XM_096389). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143196. LOC147837 (Accession XM_085915) is another VGAM2181 host target gene. LOC147837 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147837 BINDING SITE, designated SEQ ID:38391, to the nucleotide sequence of VGAM2181 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4892.

[75379] Another function of VGAM2181 is therefore inhibition of LOC147837 (Accession XM_085915). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147837. LOC149111 (Accession XM_086429) is another VGAM2181 host target gene. LOC149111 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149111 BINDING SITE, designated SEQ ID:38646, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75380] Another function of VGAM2181 is therefore inhibition of LOC149111 (Accession XM_086429). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149111. LOC149420 (Accession XM_086530) is another VGAM2181 host target gene. LOC149420 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149420, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149420 BINDING SITE, designated SEQ ID:38746, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75381] Another function of VGAM2181 is therefore inhibition of LOC149420 (Accession XM_086530). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149420. LOC151414 (Accession XM_087197) is another VGAM2181 host target gene. LOC151414 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151414 BINDING SITE, designated SEQ ID:39110, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75382] Another function of VGAM2181 is therefore inhibition of LOC151414 (Accession XM_087197). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC151414. LOC87769 (Accession XM_049058) is another VGAM2181 host target gene. LOC87769 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC87769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC87769 BINDING SITE, designated SEQ ID:35335, to the nucleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, also designated SEQ ID:4892.

[75383] Another function of VGAM2181 is therefore inhibition of LOC87769 (Accession XM_049058). Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC87769. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2182 (VGAM2182) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75384] VGAM2182 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2182 was detected is described hereinabove with reference to Figs. 1-8.

[75385] VGAM2182 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM2182 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75386] VGAM2182 gene encodes a VGAM2182 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2182 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2182 precursor RNA is designated SEQ ID:2168, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2168 is located at position 132254 relative to the genome of Yaba-like Disease Virus.

[75387] VGAM2182 precursor RNA folds onto itself, forming VGAM2182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75388] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2182 folded precursor RNA into VGAM2182 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2182 RNA is designated SEQ ID:4893, and is provided hereinbelow with reference to the sequence listing part.

[75389] VGAM2182 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2182 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2182 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75390] VGAM2182 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2182 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2182 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2182 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2182 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75391] The complementary binding of VGAM2182 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2182 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2182 host target RNA into VGAM2182 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75392] It is appreciated that VGAM2182 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2182 host target genes. The mRNA of each one of this plurality of VGAM2182 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2182 RNA, herein designated VGAM RNA, and which when bound by VGAM2182 RNA causes inhibition of translation of respective one or more VGAM2182 host target proteins.

[75393] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2182 gene, herein designated VGAM GENE, on one or more VGAM2182 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75394] It is yet further appreciated that a function of VGAM2182 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2182 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM2182 correlate with, and may be deduced from, the identity of the host target genes which VGAM2182 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75395] Nucleotide sequences of the VGAM2182 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2182 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2182 are further described hereinbelow with reference to Table 1.

[75396] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2182 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2182 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75397] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2182 gene, herein designated VGAM is inhibition of expression of VGAM2182 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2182 correlate with, and may be deduced from, the identity of the target genes which VGAM2182 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75398] Kelch-like 1 (Drosophila) (KLHL1, Accession NM_020866) is a VGAM2182 host target gene. KLHL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KLHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL1 BINDING SITE, designated SEQ ID:21920, to the nucleotide sequence of VGAM2182 RNA, herein designated VGAM RNA, also designated SEQ ID:4893.

[75399] A function of VGAM2182 is therefore inhibition of Kelch-like 1 (Drosophila) (KLHL1, Accession NM_020866). Accordingly, utilities of VGAM2182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL1. Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM_004536) is another VGAM2182 host target gene. BIRC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC1 BINDING SITE, designated SEQ ID:10882, to the nucleotide sequence of VGAM2182 RNA, herein designated VGAM RNA, also designated SEQ ID:4893.

[75400] Another function of VGAM2182 is therefore inhibition of

Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM_004536). Accordingly, utilities of VGAM2182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC1. Chromosome 20 Open Reading Frame 103 (C20orf103, Accession NM_012261) is another VGAM2182 host target gene. C20orf103 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf103 BINDING SITE, designated SEQ ID:14569, to the nucleotide sequence of VGAM2182 RNA, herein designated VGAM RNA, also designated SEQ ID:4893.

[75401] Another function of VGAM2182 is therefore inhibition of Chromosome 20 Open Reading Frame 103 (C20orf103, Accession NM_012261). Accordingly, utilities of VGAM2182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf103. KIAA1404 (Accession XM_030494) is another VGAM2182 host target gene. KIAA1404 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1404, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1404 BINDING SITE, designated SEQ ID:31048, to the nucleotide sequence of VGAM2182 RNA, herein designated VGAM RNA, also designated SEQ ID:4893.

[75402] Another function of VGAM2182 is therefore inhibition of KIAA1404 (Accession XM_030494). Accordingly, utilities of VGAM2182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1404. Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823) is another VGAM2182 host target gene. STK38L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STK38L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK38L BINDING SITE, designated SEQ ID:34287, to the nucleotide sequence of VGAM2182 RNA, herein designated VGAM RNA, also designated SEQ ID:4893.

[75403] Another function of VGAM2182 is therefore inhibition of

Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823). Accordingly, utilities of VGAM2182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38L. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2183 (VGAM2183) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75404] VGAM2183 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2183 was detected is described hereinabove with reference to Figs. 1-8.

[75405] VGAM2183 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM2183 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75406] VGAM2183 gene encodes a VGAM2183 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2183 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2183 precursor RNA is designated SEQ ID:2169, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2169 is located at position 135497 relative to the genome of Yaba-like Disease Virus.

[75407] VGAM2183 precursor RNA folds onto itself, forming VGAM2183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75408] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2183 folded precursor RNA into VGAM2183 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM2183 RNA is designated SEQ ID:4894, and is provided hereinbelow with reference to the sequence listing part.

[75409] VGAM2183 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2183 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2183 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75410] VGAM2183 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2183 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2183 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2183 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2183 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75411] The complementary binding of VGAM2183 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2183 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2183 host target RNA into VGAM2183 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75412] It is appreciated that VGAM2183 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2183 host target genes. The mRNA of each one of this plurality of VGAM2183 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2183 RNA, herein designated VGAM RNA, and which when bound by VGAM2183 RNA causes inhibition of translation of respective one or more VGAM2183 host target proteins.

[75413] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2183 gene, herein designated VGAM GENE, on one or more VGAM2183 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75414] It is yet further appreciated that a function of VGAM2183

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2183 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM2183 correlate with, and may be deduced from, the identity of the host target genes which VGAM2183 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75415] Nucleotide sequences of the VGAM2183 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2183 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2183 are further described hereinbelow with reference to Table 1.

[75416] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2183 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2183 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75417] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2183 gene, herein designated VGAM is inhibition of expression of VGAM2183 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2183 correlate with, and may be deduced from, the identity of the target genes which VGAM2183 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75418] A Disintegrin and Metalloproteinase Domain 12 (meltrin alpha) (ADAM12, Accession NM_003474) is a VGAM2183 host target gene. ADAM12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAM12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM12 BINDING SITE, designated SEQ ID:9545, to the nucleotide sequence of VGAM2183 RNA, herein designated VGAM RNA, also designated SEQ ID:4894.

[75419] A function of VGAM2183 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 12 (meltrin alpha) (ADAM12, Accession NM_003474), a gene which involved in skeletal muscle regeneration, specifically at the onset of

cell fusion. Accordingly, utilities of VGAM2183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM12. The function of ADAM12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675.Caldesmon 1 (CALD1, Accession NM_033138) is another VGAM2183 host target gene. CALD1 BINDING SITE1 and CALD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CALD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALD1 BINDING SITE1 and CALD1 BINDING SITE2, designated SEQ ID:26990 and SEQ ID:27008 respectively, to the nucleotide sequence of VGAM2183 RNA, herein designated VGAM RNA, also designated SEQ ID:4894.

[75420] Another function of VGAM2183 is therefore inhibition of Caldesmon 1 (CALD1, Accession NM_033138), a gene which is implicated in the regulation of actomyosin interactions in smooth muscle and nonmuscle cells. Accordingly, utilities of VGAM2183 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with CALD1. The function of CALD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1960.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2184 (VGAM2184) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75421] VGAM2184 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2184 was detected is described hereinabove with reference to Figs. 1-8.

[75422] VGAM2184 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2184 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75423] VGAM2184 gene encodes a VGAM2184 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2184 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2184 precursor RNA is designated SEQ ID:2170, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2170 is located at position 187541 relative to the genome of Monkeypox Virus.

[75424] VGAM2184 precursor RNA folds onto itself, forming VGAM2184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[75425] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2184 folded precursor RNA into VGAM2184 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2184 RNA is designated SEQ ID:4895, and is provided hereinbelow with reference to the sequence listing part.

[75426] VGAM2184 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2184 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2184 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75427] VGAM2184 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2184 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2184 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2184 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2184 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75428] The complementary binding of VGAM2184 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2184 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2184 host target RNA into VGAM2184 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75429] It is appreciated that VGAM2184 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2184 host target genes. The mRNA of each one of this plurality of VGAM2184 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2184 RNA, herein designated VGAM RNA, and which when bound by VGAM2184 RNA causes inhibition of translation of respective one or more VGAM2184 host target proteins.

[75430] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2184 gene, herein designated VGAM GENE, on one or more VGAM2184 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75431] It is yet further appreciated that a function of VGAM2184 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2184 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2184 correlate with, and may be deduced from, the identity of the host target genes which VGAM2184 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75432] Nucleotide sequences of the VGAM2184 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2184 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2184 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2184 are further described hereinbelow with reference to Table 1.

[75433] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2184 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2184 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75434] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2184 gene, herein designated VGAM is inhibition of expression of VGAM2184 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2184 correlate with, and may be deduced from, the identity of the target genes which VGAM2184 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75435] Angiopoietin 1 (ANGPT1, Accession NM_001146) is a VGAM2184 host target gene. ANGPT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ANGPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ANGPT1 BINDING SITE, designated SEQ ID:6813, to the nucleotide sequence of VGAM2184 RNA, herein designated VGAM RNA, also designated SEQ ID:4895.

[75436] A function of VGAM2184 is therefore inhibition of Angiopoietin 1 (ANGPT1, Accession NM_001146), a gene which binds and activates tie2 receptor by inducing its tyrosine phosphorylation. Accordingly, utilities of VGAM2184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANGPT1. The function of ANGPT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM291.FLJ10970 (Accession NM_018286) is another VGAM2184 host target gene. FLJ10970 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10970 BINDING SITE, designated SEQ ID:20279, to the nucleotide sequence of VGAM2184 RNA, herein designated VGAM RNA, also designated SEQ ID:4895.

[75437] Another function of VGAM2184 is therefore inhibition of FLJ10970 (Accession NM_018286). Accordingly, utilities of VGAM2184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10970. KIAA0976 (Accession NM_014917) is another VGAM2184 host target gene. KIAA0976 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0976 BINDING SITE, designated SEQ ID:17168, to the nucleotide sequence of VGAM2184 RNA, herein designated VGAM RNA, also designated SEQ ID:4895.

[75438] Another function of VGAM2184 is therefore inhibition of KIAA0976 (Accession NM_014917). Accordingly, utilities of VGAM2184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0976. LOC118491 (Accession XM_058324) is another VGAM2184 host target gene. LOC118491 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC118491, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118491 BINDING SITE, designated SEQ ID:36595, to the nucleotide sequence of VGAM2184 RNA, herein designated VGAM RNA, also designated SEQ ID:4895.

[75439] Another function of VGAM2184 is therefore inhibition of LOC118491 (Accession XM_058324). Accordingly, utilities of VGAM2184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118491. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2185 (VGAM2185) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75440] VGAM2185 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2185 was detected is described hereinabove with reference to Figs. 1-8.

[75441] VGAM2185 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2185 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[75442] VGAM2185 gene encodes a VGAM2185 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2185 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2185 precursor RNA is designated SEQ ID:2171, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2171 is located at position 195252 relative to the genome of Camelpox Virus.

[75443] VGAM2185 precursor RNA folds onto itself, forming VGAM2185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75444] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2185 folded precursor RNA into VGAM2185

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2185 RNA is designated SEQ ID:4896, and is provided hereinbelow with reference to the sequence listing part.

[75445] VGAM2185 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2185 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2185 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75446] VGAM2185 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2185 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2185 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2185 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2185 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75447] The complementary binding of VGAM2185 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2185 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2185 host target RNA into VGAM2185 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[75448] It is appreciated that VGAM2185 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2185 host target genes. The mRNA of each one of this plurality of VGAM2185 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2185 RNA, herein designated VGAM RNA, and which when bound by VGAM2185 RNA causes inhibition of translation of respective one or more VGAM2185 host target proteins.

[75449] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2185 gene, herein designated VGAM GENE, on one or more VGAM2185 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75450] It is yet further appreciated that a function of VGAM2185 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2185 correlate with, and may be deduced from, the identity of the host target genes which VGAM2185 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75451] Nucleotide sequences of the VGAM2185 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2185 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2185 are further described hereinbelow with reference to Table 1.

[75452] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2185 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2185 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75453] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2185 gene, herein designated VGAM is inhibition of expression of VGAM2185 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2185 correlate with, and may be deduced from, the identity of the target genes which VGAM2185 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75454] Estrogen-related Receptor Gamma (ESRRG, Accession XM_039053) is a VGAM2185 host target gene. ESRRG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESRRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRG BINDING SITE, designated SEQ ID:32999, to the nucleotide sequence of VGAM2185 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4896.

[75455] A function of VGAM2185 is therefore inhibition of Estrogen-related Receptor Gamma (ESRRG, Accession XM_039053), a gene which Estrogen-related receptor gamma. Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRG. The function of ESRRG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM359.Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209) is another VGAM2185 host target gene. ITGAL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAL BINDING SITE, designated SEQ ID:7972, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75456] Another function of VGAM2185 is therefore inhibition of Integrin, Alpha L (antigen CD11A (p180), Lymphocyte

Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209), a gene which s a receptor for icam1, icam2, icam3 and icam4. it is involved in a variety of immune phenomena including leukocyte-endothelial cell interaction, cytotoxic t-cell mediated killing, and antibody dependent killing by granulocytes and monocytes. Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAL. The function of ITGAL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Nuclear Fragile X Mental Retardation Protein Interacting Protein 1 (NUFIP1, Accession NM_012345) is another VGAM2185 host target gene. NUFIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUFIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUFIP1 BINDING SITE, designated SEQ ID:14737, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75457] Another function of VGAM2185 is therefore inhibition of Nuclear Fragile X Mental Retardation Protein Interacting Protein 1 (NUFIP1, Accession NM_012345), a gene which binds and colocalizes with nuclear fragile X mental retardation protein. Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUFIP1. The function of NUFIP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM733.POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM_006235) is another VGAM2185 host target gene. POU2AF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POU2AF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:12892, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75458] Another function of VGAM2185 is therefore inhibition of POU Domain, Class 2, Associating Factor 1 (POU2AF1, Ac-

cession NM_006235), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2. Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU2AF1. The function of POU2AF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM171.Recombination Activating Gene 2 (RAG2, Accession XM_089839) is another VGAM2185 host target gene. RAG2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAG2 BINDING SITE, designated SEQ ID:39985, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75459] Another function of VGAM2185 is therefore inhibition of Recombination Activating Gene 2 (RAG2, Accession XM_089839). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG2. Tensin (TNS, Acces-

sion NM_022648) is another VGAM2185 host target gene. TNS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNS BINDING SITE, designated SEQ ID:22903, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75460] Another function of VGAM2185 is therefore inhibition of Tensin (TNS, Accession NM_022648). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNS. DKFZP434I092 (Accession XM_042042) is another VGAM2185 host target gene. DKFZP434I092 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434I092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I092 BINDING SITE, designated SEQ ID:33673, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75461] Another function of VGAM2185 is therefore inhibition of DKFZP434I092 (Accession XM_042042). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I092. FLJ10656 (Accession NM_018170) is another VGAM2185 host target gene. FLJ10656 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10656 BINDING SITE, designated SEQ ID:19988, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75462] Another function of VGAM2185 is therefore inhibition of FLJ10656 (Accession NM_018170). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10656. GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412) is another VGAM2185 host target gene. GABARAPL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABARAPL1, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL1 BINDING SITE, designated SEQ ID:25392, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75463] Another function of VGAM2185 is therefore inhibition of GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL1. GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568) is another VGAM2185 host target gene. GABARAPL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABARAPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL3 BINDING SITE, designated SEQ ID:26300, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75464] Another function of VGAM2185 is therefore inhibition of

GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL3. HT002 (Accession NM_014066) is another VGAM2185 host target gene. HT002 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HT002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT002 BINDING SITE, designated SEQ ID:15281, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75465] Another function of VGAM2185 is therefore inhibition of HT002 (Accession NM_014066). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT002. KIAA0475 (Accession NM_014864) is another VGAM2185 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16949, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75466] Another function of VGAM2185 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. KIAA0712 (Accession NM_014715) is another VGAM2185 host target gene. KIAA0712 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0712 BINDING SITE, designated SEQ ID:16262, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75467] Another function of VGAM2185 is therefore inhibition of KIAA0712 (Accession NM_014715). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0712. KIAA1301 (Accession XM_038999) is another VGAM2185 host target gene. KIAA1301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1301 BINDING SITE, designated SEQ ID:32978, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75468] Another function of VGAM2185 is therefore inhibition of KIAA1301 (Accession XM_038999). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1301. Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869) is another VGAM2185 host target gene. SEZ6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEZ6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEZ6 BINDING SITE, designated SEQ ID:36774, to the nucleotide sequence of VGAM2185 RNA, herein

designated VGAM RNA, also designated SEQ ID:4896.

[75469] Another function of VGAM2185 is therefore inhibition of Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEZ6. VMP1 (Accession NM_030938) is another VGAM2185 host target gene. VMP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VMP1 BINDING SITE, designated SEQ ID:25204, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75470] Another function of VGAM2185 is therefore inhibition of VMP1 (Accession NM_030938). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VMP1. LOC115110 (Accession XM_049825) is another VGAM2185 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115110, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:35503, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75471] Another function of VGAM2185 is therefore inhibition of LOC115110 (Accession XM_049825). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC132235 (Accession XM_072302) is another VGAM2185 host target gene. LOC132235 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC132235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132235 BINDING SITE, designated SEQ ID:37483, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75472] Another function of VGAM2185 is therefore inhibition of LOC132235 (Accession XM_072302). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC132235. LOC142941 (Accession XM_096363) is another VGAM2185 host target gene. LOC142941 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC142941, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142941 BINDING SITE, designated SEQ ID:40322, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75473] Another function of VGAM2185 is therefore inhibition of LOC142941 (Accession XM_096363). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142941. LOC158549 (Accession XM_098963) is another VGAM2185 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42007, to

the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75474] Another function of VGAM2185 is therefore inhibition of LOC158549 (Accession XM_098963). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158549. LOC221882 (Accession XM_166507) is another VGAM2185 host target gene. LOC221882 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221882 BINDING SITE, designated SEQ ID:44434, to the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, also designated SEQ ID:4896.

[75475] Another function of VGAM2185 is therefore inhibition of LOC221882 (Accession XM_166507). Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221882. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2186 (VGAM2186) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75476] VGAM2186 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2186 was detected is described hereinabove with reference to Figs. 1-8.

[75477] VGAM2186 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2186 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75478] VGAM2186 gene encodes a VGAM2186 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2186 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2186 precursor RNA is designated SEQ ID:2172, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2172 is located at position 184211 relative to the genome of Monkeypox Virus.

[75479] VGAM2186 precursor RNA folds onto itself, forming VGAM2186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75480] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2186 folded precursor RNA into VGAM2186 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM2186 RNA is designated SEQ ID:4897, and is provided hereinbelow with reference to the sequence listing part.

[75481] VGAM2186 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2186 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2186 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75482] VGAM2186 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2186 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2186 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2186 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2186 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75483] The complementary binding of VGAM2186 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2186 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2186 host target RNA into VGAM2186 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75484] It is appreciated that VGAM2186 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2186 host target genes. The mRNA of each one of this plurality of VGAM2186 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2186 RNA, herein designated VGAM RNA, and which when bound by VGAM2186 RNA causes inhibition of translation of respective one or more VGAM2186 host target proteins.

[75485] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2186 gene, herein designated VGAM GENE, on one or more VGAM2186 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75486] It is yet further appreciated that a function of VGAM2186 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2186 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2186 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75487] Nucleotide sequences of the VGAM2186 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2186 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2186 are further described hereinbelow with reference to Table 1.

[75488] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2186 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2186 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75489] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2186 gene, herein designated VGAM is inhibition of expression of VGAM2186 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2186 correlate with, and may be deduced from, the identity of the target genes which VGAM2186

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75490] Glycoprotein M6A (GPM6A, Accession NM_005277) is a VGAM2186 host target gene. GPM6A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPM6A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPM6A BINDING SITE, designated SEQ ID:11778, to the nucleotide sequence of VGAM2186 RNA, herein designated VGAM RNA, also designated SEQ ID:4897.

[75491] A function of VGAM2186 is therefore inhibition of Glycoprotein M6A (GPM6A, Accession NM_005277), a gene which may play a role in neuronal development. Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPM6A. The function of GPM6A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM326.Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM_000139) is another VGAM2186 host target gene.

MS4A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MS4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A1 BINDING SITE, designated SEQ ID:5633, to the nucleotide sequence of VGAM2186 RNA, herein designated VGAM RNA, also designated SEQ ID:4897.

[75492] Another function of VGAM2186 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM_000139), a gene which may be involved in the regulation of b-cell activation and proliferation. Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A1. The function of MS4A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM362.Nuclear Receptor Subfamily 3, Group C, Member 1 (glucocorticoid receptor) (NR3C1, Accession NM_000176) is another VGAM2186 host target gene. NR3C1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by NR3C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR3C1 BINDING SITE, designated SEQ ID:5684, to the nucleotide sequence of VGAM2186 RNA, herein designated VGAM RNA, also designated SEQ ID:4897.

[75493] Another function of VGAM2186 is therefore inhibition of Nuclear Receptor Subfamily 3, Group C, Member 1 (glucocorticoid receptor) (NR3C1, Accession NM_000176). Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR3C1. Smcx Homolog, X Chromosome (mouse) (SMCX, Accession NM_004187) is another VGAM2186 host target gene. SMCX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMCX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMCX BINDING SITE, designated SEQ ID:10396, to the nucleotide sequence of VGAM2186 RNA, herein designated VGAM RNA, also designated SEQ ID:4897.

[75494] Another function of VGAM2186 is therefore inhibition of Smcx Homolog, X Chromosome (mouse) (SMCX, Accession NM_004187), a gene which escapes X inactivation. Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCX. The function of SMCX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.Calcyphosphine 2 (CAPS2, Accession XM_047354) is another VGAM2186 host target gene. CAPS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPS2 BINDING SITE, designated SEQ ID:34954, to the nucleotide sequence of VGAM2186 RNA, herein designated VGAM RNA, also designated SEQ ID:4897.

[75495] Another function of VGAM2186 is therefore inhibition of Calcyphosphine 2 (CAPS2, Accession XM_047354). Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with CAPS2. DKFZP434I092 (Accession XM_042042) is another VGAM2186 host target gene. DKFZP434I092 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434I092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I092 BINDING SITE, designated SEQ ID:33672, to the nucleotide sequence of VGAM2186 RNA, herein designated VGAM RNA, also designated SEQ ID:4897.

[75496] Another function of VGAM2186 is therefore inhibition of DKFZP434I092 (Accession XM_042042). Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I092. ICK (Accession NM_014920) is another VGAM2186 host target gene. ICK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:17192, to the nucleotide sequence of

VGAM2186 RNA, herein designated VGAM RNA, also designated SEQ ID:4897.

[75497] Another function of VGAM2186 is therefore inhibition of ICK (Accession NM_014920). Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK. KIAA0746 (Accession XM_045277) is another VGAM2186 host target gene. KIAA0746 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0746, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0746 BINDING SITE, designated SEQ ID:34417, to the nucleotide sequence of VGAM2186 RNA, herein designated VGAM RNA, also designated SEQ ID:4897.

[75498] Another function of VGAM2186 is therefore inhibition of KIAA0746 (Accession XM_045277). Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0746. Monocyte to Macrophage Differentiation-associated (MMD, Accession XM_008269) is another VGAM2186 host target gene. MMD BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by MMD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMD BINDING SITE, designated SEQ ID:30075, to the nucleotide sequence of VGAM2186 RNA, herein designated VGAM RNA, also designated SEQ ID:4897.

[75499] Another function of VGAM2186 is therefore inhibition of Monocyte to Macrophage Differentiation-associated (MMD, Accession XM_008269). Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMD. VIT1 (Accession NM_018693) is another VGAM2186 host target gene. VIT1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by VIT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIT1 BINDING SITE, designated SEQ ID:20767, to the nucleotide sequence of VGAM2186 RNA, herein designated VGAM RNA, also designated SEQ ID:4897.

[75500] Another function of VGAM2186 is therefore inhibition of VIT1 (Accession NM_018693). Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIT1. LOC150311 (Accession XM_086858) is another VGAM2186 host target gene. LOC150311 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150311, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150311 BINDING SITE, designated SEQ ID:38925, to the nucleotide sequence of VGAM2186 RNA, herein designated VGAM RNA, also designated SEQ ID:4897.

[75501] Another function of VGAM2186 is therefore inhibition of LOC150311 (Accession XM_086858). Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150311. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2187 (VGAM2187) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[75502] VGAM2187 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2187 was detected is described hereinabove with reference to Figs. 1-8.

[75503] VGAM2187 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2187 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75504] VGAM2187 gene encodes a VGAM2187 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2187 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2187 precursor RNA is designated SEQ ID:2173, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2173 is located at position 186422 relative to the genome of Monkeypox Virus.

[75505] VGAM2187 precursor RNA folds onto itself, forming VGAM2187 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75506] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2187 folded precursor RNA into VGAM2187 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2187 RNA is designated SEQ ID:4898, and is provided hereinbelow with reference to the sequence listing part.

[75507] VGAM2187 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2187 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2187 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75508] VGAM2187 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2187 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2187 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2187 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2187 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75509] The complementary binding of VGAM2187 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2187 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2187 host target RNA into VGAM2187 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75510] It is appreciated that VGAM2187 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2187 host target genes. The mRNA of each one of this plurality of VGAM2187 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2187 RNA, herein designated VGAM RNA, and which when bound by VGAM2187 RNA causes inhibition of translation of respective one or more VGAM2187 host target proteins.

[75511] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2187 gene, herein designated VGAM GENE, on one or more VGAM2187 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75512] It is yet further appreciated that a function of VGAM2187 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2187 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2187 correlate with, and may be deduced from, the identity of the host target genes which VGAM2187 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[75513] Nucleotide sequences of the VGAM2187 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2187 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2187 are further described hereinbelow with reference to Table 1.

[75514] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2187 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2187 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75515] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2187 gene, herein designated VGAM is inhibition of expression of VGAM2187 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2187 correlate with, and may be deduced from, the identity of the target genes which VGAM2187 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75516] Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM_000165) is a VGAM2187 host target gene. GJA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GJA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJA1 BINDING SITE, designated SEQ ID:5677, to the nucleotide sequence of VGAM2187 RNA, herein designated VGAM RNA, also designated SEQ ID:4898.

[75517] A function of VGAM2187 is therefore inhibition of Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM_000165), a gene which may act in synchronizing heart contraction and embryonic development. Accordingly, utilities of VGAM2187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJA1. The function of GJA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.Protocadherin 11 X-linked (PCDH11X, Accession NM_032968) is another VGAM2187 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites

found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26783 and SEQ ID:26798 respectively, to the nucleotide sequence of VGAM2187 RNA, herein designated VGAM RNA, also designated SEQ ID:4898.

[75518] Another function of VGAM2187 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM2187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.FLJ20184 (Accession NM_017700) is another VGAM2187 host target gene. FLJ20184 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ20184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20184 BINDING SITE, designated SEQ ID:19273, to the nucleotide sequence of VGAM2187 RNA, herein designated VGAM RNA, also designated SEQ ID:4898.

[75519] Another function of VGAM2187 is therefore inhibition of FLJ20184 (Accession NM_017700). Accordingly, utilities of VGAM2187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20184. Syntaxin 3A (STX3A, Accession NM_004177) is another VGAM2187 host target gene. STX3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STX3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX3A BINDING SITE, designated SEQ ID:10386, to the nucleotide sequence of VGAM2187 RNA, herein designated VGAM RNA, also designated SEQ ID:4898.

[75520] Another function of VGAM2187 is therefore inhibition of Syntaxin 3A (STX3A, Accession NM_004177). Accordingly,

utilities of VGAM2187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX3A. Zinc Finger Protein 313 (ZNF313, Accession NM_018683) is another VGAM2187 host target gene. ZNF313 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF313 BINDING SITE, designated SEQ ID:20754, to the nucleotide sequence of VGAM2187 RNA, herein designated VGAM RNA, also designated SEQ ID:4898.

[75521] Another function of VGAM2187 is therefore inhibition of Zinc Finger Protein 313 (ZNF313, Accession NM_018683). Accordingly, utilities of VGAM2187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF313. LOC130026 (Accession NM_138468) is another VGAM2187 host target gene. LOC130026 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130026 BINDING SITE, designated SEQ ID:28819, to the nucleotide sequence of VGAM2187 RNA, herein designated VGAM RNA, also designated SEQ ID:4898.

[75522] Another function of VGAM2187 is therefore inhibition of LOC130026 (Accession NM_138468). Accordingly, utilities of VGAM2187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130026. LOC144438 (Accession XM_084860) is another VGAM2187 host target gene. LOC144438 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144438 BINDING SITE, designated SEQ ID:37737, to the nucleotide sequence of VGAM2187 RNA, herein designated VGAM RNA, also designated SEQ ID:4898.

[75523] Another function of VGAM2187 is therefore inhibition of LOC144438 (Accession XM_084860). Accordingly, utilities of VGAM2187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC144438. LOC149722 (Accession XM_097709) is another VGAM2187 host target gene. LOC149722 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149722 BINDING SITE, designated SEQ ID:41042, to the nucleotide sequence of VGAM2187 RNA, herein designated VGAM RNA, also designated SEQ ID:4898.

[75524] Another function of VGAM2187 is therefore inhibition of LOC149722 (Accession XM_097709). Accordingly, utilities of VGAM2187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149722. LOC220988 (Accession XM_165561) is another VGAM2187 host target gene. LOC220988 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220988 BINDING SITE, designated SEQ ID:43681, to the nucleotide sequence of VGAM2187 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4898.

[75525] Another function of VGAM2187 is therefore inhibition of LOC220988 (Accession XM_165561). Accordingly, utilities of VGAM2187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220988. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2188 (VGAM2188) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75526] VGAM2188 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2188 was detected is described hereinabove with reference to Figs. 1-8.

[75527] VGAM2188 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2188 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75528] VGAM2188 gene encodes a VGAM2188 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2188 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2188 precursor RNA is designated SEQ ID:2174, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2174 is located at position 185906 relative to the genome of Monkeypox Virus.

[75529] VGAM2188 precursor RNA folds onto itself, forming VGAM2188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75530] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2188 folded precursor RNA into VGAM2188 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2188 RNA is designated SEQ ID:4899, and is provided hereinbelow with reference to the sequence listing part.

[75531] VGAM2188 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2188 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2188 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75532] VGAM2188 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2188 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2188 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2188 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2188 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75533] The complementary binding of VGAM2188 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2188 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2188 host target RNA into VGAM2188 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75534] It is appreciated that VGAM2188 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2188 host target genes. The mRNA of

each one of this plurality of VGAM2188 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2188 RNA, herein designated VGAM RNA, and which when bound by VGAM2188 RNA causes inhibition of translation of respective one or more VGAM2188 host target proteins.

[75535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2188 gene, herein designated VGAM GENE, on one or more VGAM2188 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[75536] It is yet further appreciated that a function of VGAM2188 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2188 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2188 correlate with, and may be deduced from, the identity of the host target genes which VGAM2188 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75537] Nucleotide sequences of the VGAM2188 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2188 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2188 are further described hereinbelow with reference to Table 1.

[75538] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2188 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2188 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75539] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2188 gene, herein designated VGAM is inhibition of expression of VGAM2188 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2188 correlate with, and may be deduced from, the identity of the target genes which VGAM2188 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75540] Calcitonin Receptor-like (CALCRL, Accession NM_005795) is a VGAM2188 host target gene. CALCRL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CALCRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALCRL BINDING SITE, designated SEQ ID:12377, to the nucleotide sequence of VGAM2188 RNA, herein designated VGAM RNA, also designated SEQ ID:4899.

[75541] A function of VGAM2188 is therefore inhibition of Calcitonin Receptor-like (CALCRL, Accession NM_005795), a gene which is a receptor for calcitonin gene-related pep-

tide type 1. Accordingly, utilities of VGAM2188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALCRL. The function of CALCRL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM995.Desmocollin 1 (DSC1, Accession NM_004948) is another VGAM2188 host target gene. DSC1 BINDING SITE1 and DSC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSC1 BINDING SITE1 and DSC1 BINDING SITE2, designated SEQ ID:11389 and SEQ ID:23659 respectively, to the nucleotide sequence of VGAM2188 RNA, herein designated VGAM RNA, also designated SEQ ID:4899.

[75542] Another function of VGAM2188 is therefore inhibition of Desmocollin 1 (DSC1, Accession NM_004948), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of VGAM2188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC1. The function of DSC1 and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1502.Runt-related Transcription Factor 3 (RUNX3, Accession NM_004350) is another VGAM2188 host target gene. RUNX3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RUNX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX3 BINDING SITE, designated SEQ ID:10551, to the nucleotide sequence of VGAM2188 RNA, herein designated VGAM RNA, also designated SEQ ID:4899.

[75543] Another function of VGAM2188 is therefore inhibition of Runt-related Transcription Factor 3 (RUNX3, Accession NM_004350), a gene which binds to the core site, 5'-pygpyggt-3', of a number of enhancers and promoters. Accordingly, utilities of VGAM2188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX3. The function of RUNX3 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM1151.KIAA0731 (Accession XM_039975) is another VGAM2188 host target gene. KIAA0731 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0731, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0731 BINDING SITE, designated SEQ ID:33242, to the nucleotide sequence of VGAM2188 RNA, herein designated VGAM RNA, also designated SEQ ID:4899.

[75544] Another function of VGAM2188 is therefore inhibition of KIAA0731 (Accession XM_039975). Accordingly, utilities of VGAM2188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0731. Kruppel-like Factor 5 (intestinal) (KLF5, Accession NM_001730) is another VGAM2188 host target gene. KLF5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KLF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF5 BINDING SITE, designated SEQ ID:7459,

to the nucleotide sequence of VGAM2188 RNA, herein designated VGAM RNA, also designated SEQ ID:4899.

[75545] Another function of VGAM2188 is therefore inhibition of Kruppel-like Factor 5 (intestinal) (KLF5, Accession NM_001730). Accordingly, utilities of VGAM2188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF5. LOC149773 (Accession XM_086628) is another VGAM2188 host target gene. LOC149773 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149773 BINDING SITE, designated SEQ ID:38799, to the nucleotide sequence of VGAM2188 RNA, herein designated VGAM RNA, also designated SEQ ID:4899.

[75546] Another function of VGAM2188 is therefore inhibition of LOC149773 (Accession XM_086628). Accordingly, utilities of VGAM2188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149773. LOC153387 (Accession XM_098369) is another VGAM2188 host target gene. LOC153387 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153387 BINDING SITE, designated SEQ ID:41634, to the nucleotide sequence of VGAM2188 RNA, herein designated VGAM RNA, also designated SEQ ID:4899.

[75547] Another function of VGAM2188 is therefore inhibition of LOC153387 (Accession XM_098369). Accordingly, utilities of VGAM2188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153387. LOC51157 (Accession NM_016202) is another VGAM2188 host target gene. LOC51157 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51157 BINDING SITE, designated SEQ ID:18296, to the nucleotide sequence of VGAM2188 RNA, herein designated VGAM RNA, also designated SEQ ID:4899.

[75548] Another function of VGAM2188 is therefore inhibition of

LOC51157 (Accession NM_016202). Accordingly, utilities of VGAM2188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51157. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2189 (VGAM2189) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75549] VGAM2189 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2189 was detected is described hereinabove with reference to Figs. 1-8.

[75550] VGAM2189 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2189 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75551] VGAM2189 gene encodes a VGAM2189 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2189 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2189 precursor RNA is designated SEQ ID:2175, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2175 is located at position 189835 relative to the genome of Monkeypox Virus.

[75552] VGAM2189 precursor RNA folds onto itself, forming VGAM2189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75553] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2189 folded precursor RNA into VGAM2189 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM2189 RNA is designated SEQ ID:4900, and is provided hereinbelow with reference to the sequence listing part.

[75554] VGAM2189 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2189 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2189 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75555] VGAM2189 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2189 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2189 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2189 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2189 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75556] The complementary binding of VGAM2189 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2189 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2189 host target RNA into VGAM2189 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75557] It is appreciated that VGAM2189 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2189 host target genes. The mRNA of each one of this plurality of VGAM2189 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2189 RNA, herein designated VGAM RNA, and which when bound by VGAM2189 RNA causes inhibition of translation of respective one or more VGAM2189 host target proteins.

[75558] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2189 gene, herein designated VGAM GENE, on one or more VGAM2189 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75559] It is yet further appreciated that a function of VGAM2189

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2189 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2189 correlate with, and may be deduced from, the identity of the host target genes which VGAM2189 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75560] Nucleotide sequences of the VGAM2189 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2189 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2189 are further described hereinbelow with reference to Table 1.

[75561] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2189 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2189 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75562] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2189 gene, herein designated VGAM is inhibition of expression of VGAM2189 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2189 correlate with, and may be deduced from, the identity of the target genes which VGAM2189 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75563] Coagulation Factor III (thromboplastin, tissue factor) (F3, Accession XM_040465) is a VGAM2189 host target gene. F3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F3 BINDING SITE, designated SEQ ID:33298, to the nucleotide sequence of VGAM2189 RNA, herein designated VGAM RNA, also designated SEQ ID:4900.

[75564] A function of VGAM2189 is therefore inhibition of Coagulation Factor III (thromboplastin, tissue factor) (F3, Accession XM_040465), a gene which functions in normal hemostasis. Accordingly, utilities of VGAM2189 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with F3. The function of F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM817.Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966) is another VGAM2189 host target gene. C1orf24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:27528, to the nucleotide sequence of VGAM2189 RNA, herein designated VGAM RNA, also designated SEQ ID:4900.

[75565] Another function of VGAM2189 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966). Accordingly, utilities of VGAM2189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. Epsin 2 (EPN2, Accession NM_014964) is another VGAM2189 host target gene. EPN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

EPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPN2 BINDING SITE, designated SEQ ID:17345, to the nucleotide sequence of VGAM2189 RNA, herein designated VGAM RNA, also designated SEQ ID:4900.

[75566] Another function of VGAM2189 is therefore inhibition of Epsin 2 (EPN2, Accession NM_014964). Accordingly, utilities of VGAM2189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPN2. STAF65(gamma) (Accession NM_014860) is another VGAM2189 host target gene. STAF65(gamma) BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STAF65(gamma), corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAF65(gamma) BINDING SITE, designated SEQ ID:16922, to the nucleotide sequence of VGAM2189 RNA, herein designated VGAM RNA, also designated SEQ ID:4900.

[75567] Another function of VGAM2189 is therefore inhibition of STAF65(gamma) (Accession NM_014860). Accordingly,

utilities of VGAM2189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAF65(gamma). Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2190 (VGAM2190) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75568] VGAM2190 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2190 was detected is described hereinabove with reference to Figs. 1-8.

[75569] VGAM2190 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2190 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75570] VGAM2190 gene encodes a VGAM2190 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2190 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2190 precursor RNA is designated SEQ ID:2176, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2176 is located at position 181733 relative to the genome of Monkeypox Virus.

[75571] VGAM2190 precursor RNA folds onto itself, forming VGAM2190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75572] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2190 folded precursor RNA into VGAM2190 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2190 RNA is designated SEQ ID:4901, and

is provided hereinbelow with reference to the sequence listing part.

[75573] VGAM2190 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2190 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2190 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75574] VGAM2190 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2190 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2190 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2190 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2190 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75575] The complementary binding of VGAM2190 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2190 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2190 host target RNA into VGAM2190 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75576] It is appreciated that VGAM2190 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2190 host target genes. The mRNA of each one of this plurality of VGAM2190 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2190 RNA, herein designated VGAM RNA, and which when bound by VGAM2190 RNA causes inhibition of translation of respective one or more VGAM2190 host target proteins.

[75577] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2190 gene, herein designated VGAM GENE, on one or more VGAM2190 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75578] It is yet further appreciated that a function of VGAM2190 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2190 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2190 correlate with, and may be deduced from, the identity of the host target genes which VGAM2190 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75579] Nucleotide sequences of the VGAM2190 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2190 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2190 are further described hereinbelow with reference to Table 1.

[75580] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2190 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2190 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75581] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2190 gene, herein designated VGAM is inhibition of expression of VGAM2190 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2190 correlate with, and may be deduced from, the identity of the target genes which VGAM2190 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75582] Ribonucleotide Reductase M2 Polypeptide (RRM2, Accession NM_001034) is a VGAM2190 host target gene. RRM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RRM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRM2 BINDING SITE, designated SEQ ID:6699, to the nucleotide sequence of VGAM2190 RNA, herein designated VGAM RNA, also designated SEQ ID:4901.

[75583] A function of VGAM2190 is therefore inhibition of Ribonucleotide Reductase M2 Polypeptide (RRM2, Accession NM_001034). Accordingly, utilities of VGAM2190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRM2. KIAA1762 (Accession XM_033370) is another VGAM2190 host target

gene. KIAA1762 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1762 BINDING SITE, designated SEQ ID:31910, to the nucleotide sequence of VGAM2190 RNA, herein designated VGAM RNA, also designated SEQ ID:4901.

[75584] Another function of VGAM2190 is therefore inhibition of KIAA1762 (Accession XM_033370). Accordingly, utilities of VGAM2190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1762. LOC157623 (Accession XM_088346) is another VGAM2190 host target gene. LOC157623 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157623 BINDING SITE, designated SEQ ID:39614, to the nucleotide sequence of VGAM2190 RNA, herein designated VGAM RNA, also designated SEQ ID:4901.

[75585] Another function of VGAM2190 is therefore inhibition of LOC157623 (Accession XM_088346). Accordingly, utilities of VGAM2190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157623. LOC91759 (Accession XM_040467) is another VGAM2190 host target gene. LOC91759 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91759 BINDING SITE, designated SEQ ID:33299, to the nucleotide sequence of VGAM2190 RNA, herein designated VGAM RNA, also designated SEQ ID:4901.

[75586] Another function of VGAM2190 is therefore inhibition of LOC91759 (Accession XM_040467). Accordingly, utilities of VGAM2190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91759. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2191 (VGAM2191) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[75587] VGAM2191 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2191 was detected is described hereinabove with reference to Figs. 1-8.

[75588] VGAM2191 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2191 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75589] VGAM2191 gene encodes a VGAM2191 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2191 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2191 precursor RNA is designated SEQ ID:2177, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2177 is located at position 812 relative to the genome of Monkeypox Virus.

[75590] VGAM2191 precursor RNA folds onto itself, forming VGAM2191 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75591] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2191 folded precursor RNA into VGAM2191 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2191 RNA is designated SEQ ID:4902, and is provided hereinbelow with reference to the sequence listing part.

[75592] VGAM2191 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2191 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2191 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75593] VGAM2191 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2191 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2191 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2191 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2191 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75594] The complementary binding of VGAM2191 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2191 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2191 host target RNA into VGAM2191 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75595] It is appreciated that VGAM2191 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2191 host target genes. The mRNA of each one of this plurality of VGAM2191 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2191 RNA, herein designated VGAM RNA, and which when bound by VGAM2191 RNA causes inhibition of translation of respective one or more VGAM2191 host target proteins.

[75596] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2191 gene, herein designated VGAM GENE, on one or more VGAM2191 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75597] It is yet further appreciated that a function of VGAM2191 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2191 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2191 correlate with, and may be deduced from, the identity of the host target genes which VGAM2191 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[75598] Nucleotide sequences of the VGAM2191 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2191 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2191 are further described hereinbelow with reference to Table 1.

[75599] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2191 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2191 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75600] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2191 gene, herein designated VGAM is inhibition of expression of VGAM2191 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2191 correlate with, and may be deduced from, the identity of the target genes which VGAM2191 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75601] EFG1 (Accession XM_170611) is a VGAM2191 host target gene. EFG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EFG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFG1 BINDING SITE, designated SEQ ID:45397, to the nucleotide sequence of VGAM2191 RNA, herein designated VGAM RNA, also designated SEQ ID:4902.

[75602] A function of VGAM2191 is therefore inhibition of EFG1 (Accession XM_170611), a gene which promotes the gtp-dependent translocation of the nascent protein chain from the a-site to the p-site of the ribosome in the mitochondria. Accordingly, utilities of VGAM2191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFG1. The function of EFG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1753.Solute Carrier Family 6 (neurotransmitter transporter, dopamine), Member 3 (SLC6A3, Accession NM_001044) is another VGAM2191 host target gene. SLC6A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by SLC6A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A3 BINDING SITE, designated SEQ ID:6713, to the nucleotide sequence of VGAM2191 RNA, herein designated VGAM RNA, also designated SEQ ID:4902.

[75603] Another function of VGAM2191 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, dopamine), Member 3 (SLC6A3, Accession NM_001044), a gene which terminates the action of dopamine by its high affinity sodium-dependent reuptake into presynaptic terminals. Accordingly, utilities of VGAM2191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A3. The function of SLC6A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1753.H2AV (Accession NM_138635) is another VGAM2191 host target gene. H2AV BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H2AV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AV BINDING SITE, designated SEQ ID:28912, to the nucleotide sequence of VGAM2191 RNA, herein designated VGAM RNA, also designated SEQ ID:4902.

[75604] Another function of VGAM2191 is therefore inhibition of H2AV (Accession NM_138635). Accordingly, utilities of VGAM2191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AV. HMP19 (Accession XM_113455) is another VGAM2191 host target gene. HMP19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMP19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMP19 BINDING SITE, designated SEQ ID:42273, to the nucleotide sequence of VGAM2191 RNA, herein designated VGAM RNA, also designated SEQ ID:4902.

[75605] Another function of VGAM2191 is therefore inhibition of HMP19 (Accession XM_113455). Accordingly, utilities of VGAM2191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMP19.

Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2192 (VGAM2192) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75606] VGAM2192 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2192 was detected is described hereinabove with reference to Figs. 1-8.

[75607] VGAM2192 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2192 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75608] VGAM2192 gene encodes a VGAM2192 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2192 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2192 precursor RNA is designated SEQ ID:2178, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2178 is located at position 2502 relative to the genome of Monkeypox Virus.

[75609] VGAM2192 precursor RNA folds onto itself, forming VGAM2192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75610] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2192 folded precursor RNA into VGAM2192 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2192 RNA is designated SEQ ID:4903, and is provided hereinbelow with reference to the sequence listing part.

[75611] VGAM2192 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2192 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2192 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75612] VGAM2192 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2192 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2192 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2192 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2192 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75613] The complementary binding of VGAM2192 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2192 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2192 host target RNA into VGAM2192 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75614] It is appreciated that VGAM2192 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2192 host target genes. The mRNA of each one of this plurality of VGAM2192 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2192 RNA, herein designated VGAM RNA, and which when bound by VGAM2192 RNA causes inhibition of translation of respective one or more

VGAM2192 host target proteins.

[75615] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2192 gene, herein designated VGAM GENE, on one or more VGAM2192 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75616] It is yet further appreciated that a function of VGAM2192 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2192 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific

functions, and accordingly utilities, of VGAM2192 correlate with, and may be deduced from, the identity of the host target genes which VGAM2192 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75617] Nucleotide sequences of the VGAM2192 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2192 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2192 are further described hereinbelow with reference to Table 1.

[75618] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2192 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2192 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75619] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2192 gene, herein designated VGAM is inhibition of expression of VGAM2192 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2192 correlate with, and may be deduced from, the identity of the target genes which VGAM2192 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75620] BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 1 (BACH1, Accession NM_001186) is a VGAM2192 host target gene. BACH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BACH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH1 BINDING SITE, designated SEQ ID:6855, to the nucleotide sequence of VGAM2192 RNA, herein designated VGAM RNA, also designated SEQ ID:4903.

[75621] A function of VGAM2192 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 1 (BACH1, Accession NM_001186), a gene which acts as repressor or activator, binds to nf-e2 binding sites. Accordingly, utilities of VGAM2192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH1. The function of BACH1 and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM724.Estrogen Receptor 1 (ESR1, Accession NM_000125) is another VGAM2192 host target gene. ESR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESR1 BINDING SITE, designated SEQ ID:5597, to the nucleotide sequence of VGAM2192 RNA, herein designated VGAM RNA, also designated SEQ ID:4903.

[75622] Another function of VGAM2192 is therefore inhibition of Estrogen Receptor 1 (ESR1, Accession NM_000125), a gene which involved in hormone-mediated inhibition of gene expression. Accordingly, utilities of VGAM2192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESR1. The function of ESR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM695.IDI2 (Accession NM_033261) is another VGAM2192 host target gene. IDI2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

IDI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDI2 BINDING SITE, designated SEQ ID:27089, to the nucleotide sequence of VGAM2192 RNA, herein designated VGAM RNA, also designated SEQ ID:4903.

[75623] Another function of VGAM2192 is therefore inhibition of IDI2 (Accession NM_033261). Accordingly, utilities of VGAM2192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDI2. KIAA1979 (Accession XM_113984) is another VGAM2192 host target gene. KIAA1979 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1979 BINDING SITE, designated SEQ ID:42587, to the nucleotide sequence of VGAM2192 RNA, herein designated VGAM RNA, also designated SEQ ID:4903.

[75624] Another function of VGAM2192 is therefore inhibition of KIAA1979 (Accession XM_113984). Accordingly, utilities of VGAM2192 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1979. LBP-9 (Accession NM_014553) is another VGAM2192 host target gene. LBP-9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LBP-9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBP-9 BINDING SITE, designated SEQ ID:15880, to the nucleotide sequence of VGAM2192 RNA, herein designated VGAM RNA, also designated SEQ ID:4903.

[75625] Another function of VGAM2192 is therefore inhibition of LBP-9 (Accession NM_014553). Accordingly, utilities of VGAM2192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBP-9. Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM_046054) is another VGAM2192 host target gene. LHFPL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LHFPL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHFPL2 BINDING SITE, designated SEQ

ID:34656, to the nucleotide sequence of VGAM2192 RNA, herein designated VGAM RNA, also designated SEQ ID:4903.

[75626] Another function of VGAM2192 is therefore inhibition of Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM_046054). Accordingly, utilities of VGAM2192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHFPL2. Serologically Defined Colon Cancer Antigen 43 (SDCCAG43, Accession XM_046834) is another VGAM2192 host target gene. SDCCAG43 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDCCAG43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCCAG43 BINDING SITE, designated SEQ ID:34844, to the nucleotide sequence of VGAM2192 RNA, herein designated VGAM RNA, also designated SEQ ID:4903.

[75627] Another function of VGAM2192 is therefore inhibition of Serologically Defined Colon Cancer Antigen 43 (SDCCAG43, Accession XM_046834). Accordingly, utilities of VGAM2192 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with SDCCAG43. TRAD (Accession NM_007064) is another VGAM2192 host target gene. TRAD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRAD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAD BINDING SITE, designated SEQ ID:13928, to the nucleotide sequence of VGAM2192 RNA, herein designated VGAM RNA, also designated SEQ ID:4903.

[75628] Another function of VGAM2192 is therefore inhibition of TRAD (Accession NM_007064). Accordingly, utilities of VGAM2192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAD. LOC135293 (Accession XM_072402) is another VGAM2192 host target gene. LOC135293 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC135293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135293 BINDING SITE, designated SEQ ID:37495, to

the nucleotide sequence of VGAM2192 RNA, herein designated VGAM RNA, also designated SEQ ID:4903.

[75629] Another function of VGAM2192 is therefore inhibition of LOC135293 (Accession XM_072402). Accordingly, utilities of VGAM2192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135293. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2193 (VGAM2193) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75630] VGAM2193 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2193 was detected is described hereinabove with reference to Figs. 1-8.

[75631] VGAM2193 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus.
VGAM2193 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75632] VGAM2193 gene encodes a VGAM2193 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2193 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2193 precursor RNA is designated SEQ ID:2179, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2179 is located at position 18641 relative to the genome of Cowpox Virus.

[75633] VGAM2193 precursor RNA folds onto itself, forming VGAM2193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75634] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2193 folded precursor RNA into VGAM2193 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM2193 RNA is designated SEQ ID:4904, and is provided hereinbelow with reference to the sequence listing part.

[75635] VGAM2193 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2193 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2193 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75636] VGAM2193 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2193 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2193 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2193 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2193 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75637] The complementary binding of VGAM2193 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2193 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2193 host target RNA into VGAM2193 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75638] It is appreciated that VGAM2193 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2193 host target genes. The mRNA of each one of this plurality of VGAM2193 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2193 RNA, herein designated VGAM RNA, and which when bound by VGAM2193 RNA causes inhibition of translation of respective one or more VGAM2193 host target proteins.

[75639] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2193 gene, herein designated VGAM GENE, on one or more VGAM2193 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75640] It is yet further appreciated that a function of VGAM2193 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2193 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2193 correlate with, and may be deduced from, the identity of the host target genes which VGAM2193 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75641] Nucleotide sequences of the VGAM2193 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2193 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2193 are further described hereinbelow with reference to Table 1.

[75642] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2193 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2193 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75643] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2193 gene, herein designated VGAM is inhibition of expression of VGAM2193 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2193 correlate with, and may be deduced from, the identity of the target genes which VGAM2193 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75644] Nuclear Receptor Coactivator 3 (NCOA3, Accession NM_006534) is a VGAM2193 host target gene. NCOA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCOA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA3 BINDING SITE, designated SEQ ID:13286, to the nucleotide sequence of VGAM2193 RNA, herein designated VGAM RNA, also designated SEQ ID:4904.

[75645] A function of VGAM2193 is therefore inhibition of Nuclear Receptor Coactivator 3 (NCOA3, Accession NM_006534), a

gene which directly binds nuclear receptors and stimulates the transcriptional activities in hormone-dependent fashion. Accordingly, utilities of VGAM2193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA3. The function of NCOA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215.Phenylalanine Hydroxylase (PAH, Accession NM_000277) is another VGAM2193 host target gene. PAH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAH BINDING SITE, designated SEQ ID:5823, to the nucleotide sequence of VGAM2193 RNA, herein designated VGAM RNA, also designated SEQ ID:4904.

[75646] Another function of VGAM2193 is therefore inhibition of Phenylalanine Hydroxylase (PAH, Accession NM_000277). Accordingly, utilities of VGAM2193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAH. Sialyltransferase 9

(CMP-NeuAc:lactosylceramide alpha-2,3-sialyltransferase; GM3 synthase) (SIAT9, Accession NM_003896) is another VGAM2193 host target gene. SIAT9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIAT9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT9 BINDING SITE, designated SEQ ID:9977, to the nucleotide sequence of VGAM2193 RNA, herein designated VGAM RNA, also designated SEQ ID:4904.

[75647] Another function of VGAM2193 is therefore inhibition of Sialyltransferase 9 (CMP-NeuAc:lactosylceramide alpha-2,3-sialyltransferase; GM3 synthase) (SIAT9, Accession NM_003896). Accordingly, utilities of VGAM2193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT9. LOC51075 (Accession NM_015959) is another VGAM2193 host target gene. LOC51075 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC51075 BINDING SITE, designated SEQ ID:18068, to the nucleotide sequence of VGAM2193 RNA, herein designated VGAM RNA, also designated SEQ ID:4904.

[75648] Another function of VGAM2193 is therefore inhibition of LOC51075 (Accession NM_015959). Accordingly, utilities of VGAM2193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51075. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2194 (VGAM2194) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75649] VGAM2194 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2194 was detected is described hereinabove with reference to Figs. 1-8.

[75650] VGAM2194 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2194 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[75651] VGAM2194 gene encodes a VGAM2194 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2194 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2194 precursor RNA is designated SEQ ID:2180, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2180 is located at position 269 relative to the genome of Monkeypox Virus.

[75652] VGAM2194 precursor RNA folds onto itself, forming VGAM2194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75653] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2194 folded precursor RNA into VGAM2194 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2194 RNA is designated SEQ ID:4905, and is provided hereinbelow with reference to the sequence listing part.

[75654] VGAM2194 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2194 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2194 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75655] VGAM2194 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2194 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2194 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2194 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2194 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75656] The complementary binding of VGAM2194 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2194 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2194 host target RNA into VGAM2194 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75657] It is appreciated that VGAM2194 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2194 host target genes. The mRNA of each one of this plurality of VGAM2194 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2194 RNA, herein designated VGAM RNA, and which when bound by VGAM2194 RNA causes inhibition of translation of respective one or more VGAM2194 host target proteins.

[75658] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2194 gene, herein designated VGAM GENE, on one or more VGAM2194 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75659] It is yet further appreciated that a function of VGAM2194 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2194 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2194 correlate with, and may be deduced from, the identity of the host target genes which VGAM2194 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75660] Nucleotide sequences of the VGAM2194 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2194 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2194 are further described hereinbelow with reference to Table 1.

[75661] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2194 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2194 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75662] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2194 gene, herein designated VGAM is inhibition of expression of VGAM2194 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2194 correlate with, and may be deduced from, the identity of the target genes which VGAM2194 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75663] A Disintegrin and Metalloproteinase Domain 12 (meltrin alpha) (ADAM12, Accession NM_003474) is a VGAM2194 host target gene. ADAM12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAM12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM12 BINDING SITE, designated SEQ ID:9546, to the nucleotide sequence of VGAM2194 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4905.

[75664] A function of VGAM2194 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 12 (meltrin alpha) (ADAM12, Accession NM_003474), a gene which involved in skeletal muscle regeneration, specifically at the onset of cell fusion. Accordingly, utilities of VGAM2194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM12. The function of ADAM12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675.Adducin 3 (gamma) (ADD3, Accession NM_016824) is another VGAM2194 host target gene. ADD3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADD3 BINDING SITE, designated SEQ ID:18817, to the nucleotide sequence of VGAM2194 RNA, herein designated VGAM RNA, also designated SEQ ID:4905.

[75665] Another function of VGAM2194 is therefore inhibition of Adducin 3 (gamma) (ADD3, Accession NM_016824), a

gene which membrane-cytoskeleton-associated protein that promotes the assembly of the spectrin-actin network. Accordingly, utilities of VGAM2194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD3. The function of ADD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM579.Chromosome 9 Open Reading Frame 12 (C9orf12, Accession NM_022755) is another VGAM2194 host target gene. C9orf12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf12 BINDING SITE, designated SEQ ID:22989, to the nucleotide sequence of VGAM2194 RNA, herein designated VGAM RNA, also designated SEQ ID:4905.

[75666] Another function of VGAM2194 is therefore inhibition of Chromosome 9 Open Reading Frame 12 (C9orf12, Accession NM_022755). Accordingly, utilities of VGAM2194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf12. KIAA1813

(Accession XM_046743) is another VGAM2194 host target gene. KIAA1813 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1813 BINDING SITE, designated SEQ ID:34807, to the nucleotide sequence of VGAM2194 RNA, herein designated VGAM RNA, also designated SEQ ID:4905.

[75667] Another function of VGAM2194 is therefore inhibition of KIAA1813 (Accession XM_046743). Accordingly, utilities of VGAM2194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1813. Ornithine Decarboxylase Antizyme Inhibitor (OAZIN, Accession NM_015878) is another VGAM2194 host target gene. OAZIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OAZIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAZIN BINDING SITE, designated SEQ ID:18023, to the nucleotide sequence of

VGAM2194 RNA, herein designated VGAM RNA, also designated SEQ ID:4905.

[75668] Another function of VGAM2194 is therefore inhibition of Ornithine Decarboxylase Antizyme Inhibitor (OAZIN, Accession NM_015878). Accordingly, utilities of VGAM2194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAZIN. Oncostatin M Receptor (OSMR, Accession NM_003999) is another VGAM2194 host target gene. OSMR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSMR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSMR BINDING SITE, designated SEQ ID:10149, to the nucleotide sequence of VGAM2194 RNA, herein designated VGAM RNA, also designated SEQ ID:4905.

[75669] Another function of VGAM2194 is therefore inhibition of Oncostatin M Receptor (OSMR, Accession NM_003999). Accordingly, utilities of VGAM2194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSMR. TSPAN-2 (Accession NM_005725) is another VGAM2194 host target gene.

TSPAN-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TSPAN-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSPAN-2 BINDING SITE, designated SEQ ID:12281, to the nucleotide sequence of VGAM2194 RNA, herein designated VGAM RNA, also designated SEQ ID:4905.

[75670] Another function of VGAM2194 is therefore inhibition of TSPAN-2 (Accession NM_005725). Accordingly, utilities of VGAM2194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSPAN-2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2195 (VGAM2195) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75671] VGAM2195 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2195 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[75672] VGAM2195 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM2195 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75673] VGAM2195 gene encodes a VGAM2195 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2195 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2195 precursor RNA is designated SEQ ID:2181, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2181 is located at position 9471 relative to the genome of Yaba-like Disease Virus.

[75674] VGAM2195 precursor RNA folds onto itself, forming VGAM2195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75675] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2195 folded precursor RNA into VGAM2195 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2195 RNA is designated SEQ ID:4906, and is provided hereinbelow with reference to the sequence listing part.

[75676] VGAM2195 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2195 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2195 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75677] VGAM2195 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2195 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2195 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2195 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2195 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75678] The complementary binding of VGAM2195 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2195 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2195 host target RNA into VGAM2195 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75679] It is appreciated that VGAM2195 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2195 host target genes. The mRNA of each one of this plurality of VGAM2195 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2195 RNA, herein designated VGAM RNA, and which when bound by VGAM2195 RNA causes inhibition of translation of respective one or more VGAM2195 host target proteins.

[75680] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2195 gene, herein designated VGAM GENE, on one or more VGAM2195 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75681] It is yet further appreciated that a function of VGAM2195 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2195 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM2195 correlate with, and may be deduced from, the identity of the host target genes which VGAM2195 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75682] Nucleotide sequences of the VGAM2195 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2195 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2195 are further described hereinbelow with reference to Table 1.

[75683] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2195 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2195 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75684] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2195 gene, herein designated VGAM is inhibition of expression of VGAM2195 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2195 correlate with, and may be deduced from, the identity of the target genes which VGAM2195 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75685] LOC256846 (Accession XM_170921) is a VGAM2195 host target gene. LOC256846 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256846 BINDING SITE, designated SEQ ID:45695, to the nucleotide sequence of VGAM2195 RNA, herein designated VGAM RNA, also designated SEQ ID:4906.

[75686] A function of VGAM2195 is therefore inhibition of LOC256846 (Accession XM_170921). Accordingly, utilities of VGAM2195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256846. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2196 (VGAM2196) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75687] VGAM2196 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2196 was detected is described hereinabove with reference to Figs. 1-8.

[75688] VGAM2196 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM2196 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[75689] VGAM2196 gene encodes a VGAM2196 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2196 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2196 precursor RNA is designated SEQ ID:2182, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2182 is located at position 11842 relative to the genome of Yaba-like Disease Virus.

[75690] VGAM2196 precursor RNA folds onto itself, forming VGAM2196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75691] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2196 folded precursor RNA into VGAM2196

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2196 RNA is designated SEQ ID:4907, and is provided hereinbelow with reference to the sequence listing part.

[75692] VGAM2196 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2196 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2196 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75693] VGAM2196 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2196 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2196 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2196 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2196 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75694] The complementary binding of VGAM2196 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2196 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2196 host target RNA into VGAM2196 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[75695] It is appreciated that VGAM2196 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2196 host target genes. The mRNA of each one of this plurality of VGAM2196 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2196 RNA, herein designated VGAM RNA, and which when bound by VGAM2196 RNA causes inhibition of translation of respective one or more VGAM2196 host target proteins.

[75696] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2196 gene, herein designated VGAM GENE, on one or more VGAM2196 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75697] It is yet further appreciated that a function of VGAM2196 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2196 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM2196 correlate with, and may be deduced from, the identity of the host target genes which VGAM2196 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75698] Nucleotide sequences of the VGAM2196 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2196 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2196 are further described hereinbelow with reference to Table 1.

[75699] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2196 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2196 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75700] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2196 gene, herein designated VGAM is inhibition of expression of VGAM2196 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2196 correlate with, and may be deduced from, the identity of the target genes which VGAM2196 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75701] Tripartite Motif-containing 34 (TRIM34, Accession NM_021616) is a VGAM2196 host target gene. TRIM34 BINDING SITE1 and TRIM34 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRIM34, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM34 BINDING SITE1 and TRIM34 BINDING SITE2, designated SEQ ID:22248 and SEQ

ID:28172 respectively, to the nucleotide sequence of VGAM2196 RNA, herein designated VGAM RNA, also designated SEQ ID:4907.

[75702] A function of VGAM2196 is therefore inhibition of Tripartite Motif-containing 34 (TRIM34, Accession NM_021616). Accordingly, utilities of VGAM2196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM34. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2197 (VGAM2197) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75703] VGAM2197 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2197 was detected is described hereinabove with reference to Figs. 1-8.

[75704] VGAM2197 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM2197 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75705] VGAM2197 gene encodes a VGAM2197 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2197 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2197 precursor RNA is designated SEQ ID:2183, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2183 is located at position 6543 relative to the genome of Yaba-like Disease Virus.

[75706] VGAM2197 precursor RNA folds onto itself, forming VGAM2197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75707] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2197 folded precursor RNA into VGAM2197 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2197 RNA is designated SEQ ID:4908, and is provided hereinbelow with reference to the sequence listing part.

[75708] VGAM2197 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2197 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2197 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75709] VGAM2197 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2197 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2197 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2197 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2197 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75710] The complementary binding of VGAM2197 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2197 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2197 host target RNA into VGAM2197 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75711] It is appreciated that VGAM2197 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2197 host target genes. The mRNA of each one of this plurality of VGAM2197 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2197 RNA, herein designated VGAM RNA, and which when bound by VGAM2197 RNA causes inhibition of translation of respective one or more VGAM2197 host target proteins.

[75712] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2197 gene, herein designated VGAM GENE, on one or more VGAM2197 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75713] It is yet further appreciated that a function of VGAM2197 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM2197 correlate with, and may be deduced from, the identity of the host target genes which VGAM2197 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75714] Nucleotide sequences of the VGAM2197 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2197 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2197 are further described hereinbelow with reference to Table 1.

[75715] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2197 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2197 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75716] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2197 gene, herein designated VGAM is inhibition of expression of VGAM2197 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2197 correlate with, and may be deduced from, the identity of the target genes which VGAM2197 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75717] Caspase Recruitment Domain Family, Member 4 (CARD4, Accession NM_006092) is a VGAM2197 host target gene. CARD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CARD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD4 BINDING SITE, designated SEQ ID:12742, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75718] A function of VGAM2197 is therefore inhibition of Caspase Recruitment Domain Family, Member 4 (CARD4, Accession NM_006092), a gene which Activates CASP9 to induce apoptosis, regulates activation of NF-kappaB. Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD4. The function of CARD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM492.Chemokine (C-X-C motif) Receptor 6 (CXCR6, Accession NM_006564) is another VGAM2197 host target gene. CXCR6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CXCR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXCR6 BINDING SITE, designated SEQ ID:13334, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75719] Another function of VGAM2197 is therefore inhibition of Chemokine (C-X-C motif) Receptor 6 (CXCR6, Accession NM_006564), a gene which probably interacts between

dendritic cells and T cells and regulates T-cell migration. Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCR6. The function of CXCR6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2144.Phosphoribosyl Pyrophosphate Synthetase-associated Protein 1 (PRPSAP1, Accession NM_002766) is another VGAM2197 host target gene. PRPSAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRPSAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPSAP1 BINDING SITE, designated SEQ ID:8659, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75720] Another function of VGAM2197 is therefore inhibition of Phosphoribosyl Pyrophosphate Synthetase-associated Protein 1 (PRPSAP1, Accession NM_002766), a gene which catalyzes the formation of PRPP from ATP and ribose 5-phosphate. Accordingly, utilities of VGAM2197 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPSAP1. The function of PRPSAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM914.SH3 and Multiple Ankyrin Repeat Domains 2 (SHANK2, Accession NM_012309) is another VGAM2197 host target gene. SHANK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SHANK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHANK2 BINDING SITE, designated SEQ ID:14683, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75721] Another function of VGAM2197 is therefore inhibition of SH3 and Multiple Ankyrin Repeat Domains 2 (SHANK2, Accession NM_012309). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHANK2. SMURF1 (Accession XM_166483) is another VGAM2197 host target gene. SMURF1 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by SMURF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMURF1 BINDING SITE, designated SEQ ID:44417, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75722] Another function of VGAM2197 is therefore inhibition of SMURF1 (Accession XM_166483). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMURF1. TEM6 (Accession NM_022748) is another VGAM2197 host target gene. TEM6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM6 BINDING SITE, designated SEQ ID:22962, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75723] Another function of VGAM2197 is therefore inhibition of

TEM6 (Accession NM_022748), a gene which displayes elevated expression during tumor angiogenesis. Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM6. The function of TEM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175.Chromosome 1 Open Reading Frame 9 (C1orf9, Accession NM_016227) is another VGAM2197 host target gene. C1orf9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf9 BINDING SITE, designated SEQ ID:18340, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75724] Another function of VGAM2197 is therefore inhibition of Chromosome 1 Open Reading Frame 9 (C1orf9, Accession NM_016227). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf9. Chromosome 20

Open Reading Frame 4 (C20orf4, Accession NM_015511) is another VGAM2197 host target gene. C20orf4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf4 BINDING SITE, designated SEQ ID:17773, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75725] Another function of VGAM2197 is therefore inhibition of Chromosome 20 Open Reading Frame 4 (C20orf4, Accession NM_015511). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf4. Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_000793) is another VGAM2197 host target gene. DIO2 BINDING SITE1 and DIO2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DIO2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE1 and DIO2 BINDING SITE2,

designated SEQ ID:6463 and SEQ ID:15174 respectively, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75726] Another function of VGAM2197 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_000793). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. HSH2 (Accession NM_032855) is another VGAM2197 host target gene. HSH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSH2 BINDING SITE, designated SEQ ID:26655, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75727] Another function of VGAM2197 is therefore inhibition of HSH2 (Accession NM_032855). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSH2. KIAA0322 (Accession XM_166591) is another VGAM2197 host target gene. KIAA0322 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by KIAA0322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0322 BINDING SITE, designated SEQ ID:44561, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75728] Another function of VGAM2197 is therefore inhibition of KIAA0322 (Accession XM_166591). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0322. KIAA0700 (Accession XM_050561) is another VGAM2197 host target gene. KIAA0700 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0700 BINDING SITE, designated SEQ ID:35661, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75729] Another function of VGAM2197 is therefore inhibition of

KIAA0700 (Accession XM_050561). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0700. KIAA1045 (Accession XM_048592) is another VGAM2197 host target gene. KIAA1045 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:35197, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75730] Another function of VGAM2197 is therefore inhibition of KIAA1045 (Accession XM_048592). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045. KIAA1163 (Accession XM_086231) is another VGAM2197 host target gene. KIAA1163 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1163 BINDING SITE, designated SEQ ID:38558, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75731] Another function of VGAM2197 is therefore inhibition of KIAA1163 (Accession XM_086231). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1163. KIAA1673 (Accession XM_047672) is another VGAM2197 host target gene. KIAA1673 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1673 BINDING SITE, designated SEQ ID:35028, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75732] Another function of VGAM2197 is therefore inhibition of KIAA1673 (Accession XM_047672). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1673. MGC4172 (Accession NM_024308) is another

VGAM2197 host target gene. MGC4172 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4172 BINDING SITE, designated SEQ ID:23602, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75733] Another function of VGAM2197 is therefore inhibition of MGC4172 (Accession NM_024308). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4172. LOC132332 (Accession XM_072306) is another VGAM2197 host target gene. LOC132332 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC132332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132332 BINDING SITE, designated SEQ ID:37489, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75734] Another function of VGAM2197 is therefore inhibition of LOC132332 (Accession XM_072306). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132332. LOC138654 (Accession XM_071015) is another VGAM2197 host target gene. LOC138654 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138654 BINDING SITE, designated SEQ ID:37398, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75735] Another function of VGAM2197 is therefore inhibition of LOC138654 (Accession XM_071015). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138654. LOC149670 (Accession XM_086647) is another VGAM2197 host target gene. LOC149670 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149670, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149670 BINDING SITE, designated SEQ ID:38807, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75736] Another function of VGAM2197 is therefore inhibition of LOC149670 (Accession XM_086647). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149670. LOC157695 (Accession XM_098811) is another VGAM2197 host target gene. LOC157695 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157695, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157695 BINDING SITE, designated SEQ ID:41831, to the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, also designated SEQ ID:4908.

[75737] Another function of VGAM2197 is therefore inhibition of LOC157695 (Accession XM_098811). Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157695. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2198 (VGAM2198) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75738] VGAM2198 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2198 was detected is described hereinabove with reference to Figs. 1-8.

[75739] VGAM2198 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM2198 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75740] VGAM2198 gene encodes a VGAM2198 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2198 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2198 precursor RNA is designated SEQ ID:2184, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2184 is located at position 22309 relative to the genome of Yaba-like Disease Virus.

[75741] VGAM2198 precursor RNA folds onto itself, forming VGAM2198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75742] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2198 folded precursor RNA into VGAM2198 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2198 RNA is designated SEQ ID:4909, and is provided hereinbelow with reference to the sequence listing part.

[75743] VGAM2198 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2198 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2198 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75744] VGAM2198 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2198 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2198 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2198 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2198 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75745] The complementary binding of VGAM2198 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2198 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2198 host target RNA into VGAM2198 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75746] It is appreciated that VGAM2198 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2198 host target genes. The mRNA of each one of this plurality of VGAM2198 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2198 RNA, herein designated VGAM RNA, and which when bound by VGAM2198 RNA causes

inhibition of translation of respective one or more VGAM2198 host target proteins.

[75747] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2198 gene, herein designated VGAM GENE, on one or more VGAM2198 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75748] It is yet further appreciated that a function of VGAM2198 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2198 include diagnosis, prevention and

treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM2198 correlate with, and may be deduced from, the identity of the host target genes which VGAM2198 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75749] Nucleotide sequences of the VGAM2198 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2198 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2198 are further described hereinbelow with reference to Table 1.

[75750] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2198 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2198 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75751] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2198 gene, herein designated VGAM is inhibition of expression of VGAM2198 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2198 correlate with, and may be deduced from, the identity of the target genes which VGAM2198 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75752] Collagen, Type IV, Alpha 5 (Alport syndrome) (COL4A5, Accession NM_000495) is a VGAM2198 host target gene. COL4A5 BINDING SITE1 through COL4A5 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL4A5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A5 BINDING SITE1 through COL4A5 BINDING SITE3, designated SEQ ID:6108, SEQ ID:27211 and SEQ ID:27214 respectively, to the nucleotide sequence of VGAM2198 RNA, herein designated VGAM RNA, also designated SEQ ID:4909.

[75753] A function of VGAM2198 is therefore inhibition of Collagen, Type IV, Alpha 5 (Alport syndrome) (COL4A5, Accession NM_000495). Accordingly, utilities of VGAM2198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A5. MGC10646

(Accession NM_032693) is another VGAM2198 host target gene. MGC10646 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC10646, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10646 BINDING SITE, designated SEQ ID:26413, to the nucleotide sequence of VGAM2198 RNA, herein designated VGAM RNA, also designated SEQ ID:4909.

[75754] Another function of VGAM2198 is therefore inhibition of MGC10646 (Accession NM_032693). Accordingly, utilities of VGAM2198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10646. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2199 (VGAM2199) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75755] VGAM2199 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2199 was detected is described hereinabove with reference to Figs. 1-8.

[75756] VGAM2199 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM2199 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75757] VGAM2199 gene encodes a VGAM2199 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2199 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2199 precursor RNA is designated SEQ ID:2185, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2185 is located at position 3375 relative to the genome of Yaba-like Disease Virus.

[75758] VGAM2199 precursor RNA folds onto itself, forming VGAM2199 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75759] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2199 folded precursor RNA into VGAM2199 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2199 RNA is designated SEQ ID:4910, and is provided hereinbelow with reference to the sequence listing part.

[75760] VGAM2199 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2199 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2199 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75761] VGAM2199 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2199 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2199 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2199 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2199 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75762] The complementary binding of VGAM2199 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2199 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2199 host target RNA into VGAM2199 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75763] It is appreciated that VGAM2199 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2199 host target genes. The mRNA of each one of this plurality of VGAM2199 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2199 RNA, herein designated VGAM RNA, and which when bound by VGAM2199 RNA causes inhibition of translation of respective one or more VGAM2199 host target proteins.

[75764] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2199 gene, herein designated VGAM GENE, on one or more VGAM2199 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75765] It is yet further appreciated that a function of VGAM2199 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2199 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM2199 correlate with, and may be deduced from, the identity of the host target genes which VGAM2199 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75766] Nucleotide sequences of the VGAM2199 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2199 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2199 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2199 are further described hereinbelow with reference to Table 1.

[75767] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2199 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2199 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75768] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2199 gene, herein designated VGAM is inhibition of expression of VGAM2199 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2199 correlate with, and may be deduced from, the identity of the target genes which VGAM2199 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75769] LOC219672 (Accession XM_166111) is a VGAM2199 host target gene. LOC219672 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219672, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219672 BINDING SITE, designated SEQ ID:43888, to the nucleotide sequence of VGAM2199 RNA, herein designated VGAM RNA, also designated SEQ ID:4910.

[75770] A function of VGAM2199 is therefore inhibition of LOC219672 (Accession XM_166111). Accordingly, utilities of VGAM2199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219672. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2200 (VGAM2200) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75771] VGAM2200 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2200 was detected is described hereinabove with reference to Figs. 1-8.

[75772] VGAM2200 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus.

VGAM2200 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75773] VGAM2200 gene encodes a VGAM2200 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2200 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2200 precursor RNA is designated SEQ ID:2186, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2186 is located at position 184637 relative to the genome of Cowpox Virus.

[75774] VGAM2200 precursor RNA folds onto itself, forming VGAM2200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75775] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2200 folded precursor RNA into VGAM2200 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2200 RNA is designated SEQ ID:4911, and is provided hereinbelow with reference to the sequence listing part.

[75776] VGAM2200 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2200 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2200 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75777] VGAM2200 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2200 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2200 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2200 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2200 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75778] The complementary binding of VGAM2200 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2200 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2200 host target RNA into VGAM2200 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75779] It is appreciated that VGAM2200 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2200 host target genes. The mRNA of each one of this plurality of VGAM2200 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2200 RNA, herein designated VGAM RNA, and which when bound by VGAM2200 RNA causes inhibition of translation of respective one or more VGAM2200 host target proteins.

[75780] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2200 gene, herein designated VGAM GENE, on one or more VGAM2200 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75781] It is yet further appreciated that a function of VGAM2200 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2200 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2200 correlate with, and may be deduced from, the identity of the host target genes which VGAM2200 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75782] Nucleotide sequences of the VGAM2200 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2200 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2200 are further described hereinbelow with reference to Table 1.

[75783] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2200 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2200 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75784] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2200 gene, herein designated VGAM is inhibition of expression of VGAM2200 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2200 correlate with, and may be deduced from, the identity of the target genes which VGAM2200 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75785] ENDOFIN (Accession NM_014733) is a VGAM2200 host target gene. ENDOFIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENDOFIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENDOFIN BINDING SITE, designated SEQ ID:16368, to the nucleotide sequence of

VGAM2200 RNA, herein designated VGAM RNA, also designated SEQ ID:4911.

[75786] A function of VGAM2200 is therefore inhibition of ENDOFIN (Accession NM_014733). Accordingly, utilities of VGAM2200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENDOFIN. FLJ10498 (Accession NM_018115) is another VGAM2200 host target gene. FLJ10498 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10498, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10498 BINDING SITE, designated SEQ ID:19886, to the nucleotide sequence of VGAM2200 RNA, herein designated VGAM RNA, also designated SEQ ID:4911.

[75787] Another function of VGAM2200 is therefore inhibition of FLJ10498 (Accession NM_018115). Accordingly, utilities of VGAM2200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10498. KIAA0534 (Accession XM_049349) is another VGAM2200 host target gene. KIAA0534 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA0534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0534 BINDING SITE, designated SEQ ID:35381, to the nucleotide sequence of VGAM2200 RNA, herein designated VGAM RNA, also designated SEQ ID:4911.

[75788] Another function of VGAM2200 is therefore inhibition of KIAA0534 (Accession XM_049349). Accordingly, utilities of VGAM2200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0534. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2201 (VGAM2201) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75789] VGAM2201 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2201 was detected is described hereinabove with reference to Figs. 1-8.

[75790] VGAM2201 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cowpox Virus. VGAM2201 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75791] VGAM2201 gene encodes a VGAM2201 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2201 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2201 precursor RNA is designated SEQ ID:2187, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2187 is located at position 185848 relative to the genome of Cowpox Virus.

[75792] VGAM2201 precursor RNA folds onto itself, forming VGAM2201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75793] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2201 folded precursor RNA into VGAM2201 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2201 RNA is designated SEQ ID:4912, and is provided hereinbelow with reference to the sequence listing part.

[75794] VGAM2201 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2201 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2201 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75795] VGAM2201 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2201 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2201 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2201 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2201 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75796] The complementary binding of VGAM2201 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2201 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2201

host target RNA into VGAM2201 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75797] It is appreciated that VGAM2201 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2201 host target genes. The mRNA of each one of this plurality of VGAM2201 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2201 RNA, herein designated VGAM RNA, and which when bound by VGAM2201 RNA causes inhibition of translation of respective one or more VGAM2201 host target proteins.

[75798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2201 gene, herein designated VGAM GENE, on one or more VGAM2201 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75799] It is yet further appreciated that a function of VGAM2201 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2201 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2201 correlate with, and may be deduced from, the identity of the host target genes which VGAM2201 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75800] Nucleotide sequences of the VGAM2201 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2201 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2201 are further

described hereinbelow with reference to Table 1.

[75801] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2201 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2201 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75802] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2201 gene, herein designated VGAM is inhibition of expression of VGAM2201 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2201 correlate with, and may be deduced from, the identity of the target genes which VGAM2201 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75803] Alpha-methylacyl-CoA Racemase (AMACR, Accession XM_043771) is a VGAM2201 host target gene. AMACR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AMACR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of AMACR BINDING SITE, designated SEQ ID:34016, to the nucleotide sequence of VGAM2201 RNA, herein designated VGAM RNA, also designated SEQ ID:4912.

[75804] A function of VGAM2201 is therefore inhibition of Alpha-methylacyl-CoA Racemase (AMACR, Accession XM_043771). Accordingly, utilities of VGAM2201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMACR. ATPase, H+ Transporting, Lysosomal 13kDa, V1 Subunit G Isoform 2 (ATP6V1G2, Accession NM_130463) is another VGAM2201 host target gene. ATP6V1G2 BINDING SITE1 and ATP6V1G2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATP6V1G2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1G2 BINDING SITE1 and ATP6V1G2 BINDING SITE2, designated SEQ ID:28222 and SEQ ID:28696 respectively, to the nucleotide sequence of VGAM2201 RNA, herein designated VGAM RNA, also designated SEQ ID:4912.

[75805] Another function of VGAM2201 is therefore inhibition of ATPase, H+ Transporting, Lysosomal 13kDa, V1 Subunit G

Isoform 2 (ATP6V1G2, Accession NM_130463). Accordingly, utilities of VGAM2201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1G2. FLJ00007 (Accession XM_048928) is another VGAM2201 host target gene. FLJ00007 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00007 BINDING SITE, designated SEQ ID:35309, to the nucleotide sequence of VGAM2201 RNA, herein designated VGAM RNA, also designated SEQ ID:4912.

[75806] Another function of VGAM2201 is therefore inhibition of FLJ00007 (Accession XM_048928). Accordingly, utilities of VGAM2201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00007. FLJ13105 (Accession NM_025001) is another VGAM2201 host target gene. FLJ13105 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13105, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ13105 BINDING SITE, designated SEQ ID:24570, to the nucleotide sequence of VGAM2201 RNA, herein designated VGAM RNA, also designated SEQ ID:4912.

[75807] Another function of VGAM2201 is therefore inhibition of FLJ13105 (Accession NM_025001). Accordingly, utilities of VGAM2201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13105. Protein Tyrosine Phosphatase, Receptor Type, R (PTPRR, Accession NM_130846) is another VGAM2201 host target gene. PTPRR BINDING SITE1 and PTPRR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRR BINDING SITE1 and PTPRR BINDING SITE2, designated SEQ ID:28381 and SEQ ID:8742 respectively, to the nucleotide sequence of VGAM2201 RNA, herein designated VGAM RNA, also designated SEQ ID:4912.

[75808] Another function of VGAM2201 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, R (PTPRR, Accession NM_130846). Accordingly, utilities of

VGAM2201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRR. LOC150213 (Accession XM_059324) is another VGAM2201 host target gene. LOC150213 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150213 BINDING SITE, designated SEQ ID:36958, to the nucleotide sequence of VGAM2201 RNA, herein designated VGAM RNA, also designated SEQ ID:4912.

[75809] Another function of VGAM2201 is therefore inhibition of LOC150213 (Accession XM_059324). Accordingly, utilities of VGAM2201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150213. LOC151742 (Accession NM_139245) is another VGAM2201 host target gene. LOC151742 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC151742 BINDING SITE, designated SEQ ID:29240, to the nucleotide sequence of VGAM2201 RNA, herein designated VGAM RNA, also designated SEQ ID:4912.

[75810] Another function of VGAM2201 is therefore inhibition of LOC151742 (Accession NM_139245). Accordingly, utilities of VGAM2201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151742. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2202 (VGAM2202) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75811] VGAM2202 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2202 was detected is described hereinabove with reference to Figs. 1-8.

[75812] VGAM2202 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2202 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75813] VGAM2202 gene encodes a VGAM2202 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2202 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2202 precursor RNA is designated SEQ ID:2188, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2188 is located at position 162506 relative to the genome of Camelpox Virus.

[75814] VGAM2202 precursor RNA folds onto itself, forming VGAM2202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75815] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2202 folded precursor RNA into VGAM2202 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2202 RNA is designated SEQ ID:4913, and is provided hereinbelow with reference to the sequence listing part.

[75816] VGAM2202 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2202 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2202 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75817] VGAM2202 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2202 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2202 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2202 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2202 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75818] The complementary binding of VGAM2202 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2202 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2202 host target RNA into VGAM2202 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75819] It is appreciated that VGAM2202 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2202 host target genes. The mRNA of each one of this plurality of VGAM2202 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2202 RNA, herein designated VGAM RNA, and which when bound by VGAM2202 RNA causes inhibition of translation of respective one or more VGAM2202 host target proteins.

[75820] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2202 gene, herein designated VGAM GENE, on one or more VGAM2202 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75821] It is yet further appreciated that a function of VGAM2202 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2202 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2202 correlate with, and may be deduced from, the identity of the host target genes which VGAM2202 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75822] Nucleotide sequences of the VGAM2202 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2202 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2202 are further described hereinbelow with reference to Table 1.

[75823] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2202 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2202 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75824] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2202 gene, herein designated VGAM is inhibition of expression of VGAM2202 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2202 correlate with, and may be deduced from, the identity of the target genes which VGAM2202 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75825] Actinin, Alpha 2 (ACTN2, Accession NM_001103) is a VGAM2202 host target gene. ACTN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTN2 BINDING SITE, designated SEQ ID:6754, to the nucleotide sequence of VGAM2202 RNA, herein designated VGAM RNA, also designated SEQ ID:4913.

[75826] A function of VGAM2202 is therefore inhibition of Actinin,

Alpha 2 (ACTN2, Accession NM_001103), a gene which an actin-binding protein with multiple roles in different cell types. Accordingly, utilities of VGAM2202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTN2. The function of ACTN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM88.Synaptotagmin I (SYT1, Accession NM_005639) is another VGAM2202 host target gene. SYT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT1 BINDING SITE, designated SEQ ID:12168, to the nucleotide sequence of VGAM2202 RNA, herein designated VGAM RNA, also designated SEQ ID:4913.

[75827] Another function of VGAM2202 is therefore inhibition of Synaptotagmin I (SYT1, Accession NM_005639), a gene which may have a regulatory role in the membrane interactions during trafficking of synaptic vesicles at the active zone of the synapse. Accordingly, utilities of VGAM2202

include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT1. The function of SYT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM739.FLJ22173 (Accession NM_025041) is another VGAM2202 host target gene. FLJ22173 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22173 BINDING SITE, designated SEQ ID:24635, to the nucleotide sequence of VGAM2202 RNA, herein designated VGAM RNA, also designated SEQ ID:4913.

[75828] Another function of VGAM2202 is therefore inhibition of FLJ22173 (Accession NM_025041). Accordingly, utilities of VGAM2202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22173. SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469) is another VGAM2202 host target gene. SH3BGRL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by SH3BGRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL2 BINDING SITE, designated SEQ ID:25524, to the nucleotide sequence of VGAM2202 RNA, herein designated VGAM RNA, also designated SEQ ID:4913.

[75829] Another function of VGAM2202 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469). Accordingly, utilities of VGAM2202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL2. LOC146823 (Accession XM_097105) is another VGAM2202 host target gene. LOC146823 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146823 BINDING SITE, designated SEQ ID:40745, to the nucleotide sequence of VGAM2202 RNA, herein designated VGAM RNA, also designated SEQ ID:4913.

[75830] Another function of VGAM2202 is therefore inhibition of

LOC146823 (Accession XM_097105). Accordingly, utilities of VGAM2202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146823. LOC255231 (Accession XM_170908) is another VGAM2202 host target gene. LOC255231 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255231 BINDING SITE, designated SEQ ID:45671, to the nucleotide sequence of VGAM2202 RNA, herein designated VGAM RNA, also designated SEQ ID:4913.

[75831] Another function of VGAM2202 is therefore inhibition of LOC255231 (Accession XM_170908). Accordingly, utilities of VGAM2202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255231. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2203 (VGAM2203) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[75832] VGAM2203 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2203 was detected is described hereinabove with reference to Figs. 1-8.

[75833] VGAM2203 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2203 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75834] VGAM2203 gene encodes a VGAM2203 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2203 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2203 precursor RNA is designated SEQ ID:2189, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2189 is located at position 173794 relative to the genome of Cowpox Virus.

[75835] VGAM2203 precursor RNA folds onto itself, forming VGAM2203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75836] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2203 folded precursor RNA into VGAM2203 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2203 RNA is designated SEQ ID:4914, and is provided hereinbelow with reference to the sequence listing part.

[75837] VGAM2203 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2203 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2203 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75838] VGAM2203 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2203 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2203 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2203 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2203 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[75839] The complementary binding of VGAM2203 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2203 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2203 host target RNA into VGAM2203 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75840] It is appreciated that VGAM2203 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2203 host target genes. The mRNA of each one of this plurality of VGAM2203 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2203 RNA, herein designated VGAM RNA, and which when bound by VGAM2203 RNA causes inhibition of translation of respective one or more VGAM2203 host target proteins.

[75841] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2203 gene, herein designated VGAM GENE, on one

or more VGAM2203 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75842] It is yet further appreciated that a function of VGAM2203 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2203 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2203 correlate with, and may be deduced from, the identity of the host target genes which VGAM2203 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75843] Nucleotide sequences of the VGAM2203 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2203 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2203 are further described hereinbelow with reference to Table 1.

[75844] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2203 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2203 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75845] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2203 gene, herein designated VGAM is inhibition of expression of VGAM2203 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2203 correlate with, and may be deduced from, the identity of the target genes which VGAM2203 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75846] Espin (ESPN, Accession NM_031475) is a VGAM2203 host

target gene. ESPN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESPN BINDING SITE, designated SEQ ID:25548, to the nucleotide sequence of VGAM2203 RNA, herein designated VGAM RNA, also designated SEQ ID:4914.

[75847] A function of VGAM2203 is therefore inhibition of Espin (ESPN, Accession NM_031475), a gene which a membrane-cytoskeletal assemblages . Accordingly, utilities of VGAM2203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESPN. The function of ESPN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1006.Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM_085943) is another VGAM2203 host target gene. GRLF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRLF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, designated SEQ ID:38407, to the nucleotide sequence of VGAM2203 RNA, herein designated VGAM RNA, also designated SEQ ID:4914.

[75848] Another function of VGAM2203 is therefore inhibition of Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM_085943), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of VGAM2203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRLF1. The function of GRLF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Integrin, Alpha 2 (CD49B, alpha 2 subunit of VLA-2 receptor) (ITGA2, Accession NM_002203) is another VGAM2203 host target gene. ITGA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA2 BINDING SITE, designated SEQ ID:7962,

to the nucleotide sequence of VGAM2203 RNA, herein designated VGAM RNA, also designated SEQ ID:4914.

[75849] Another function of VGAM2203 is therefore inhibition of Integrin, Alpha 2 (CD49B, alpha 2 subunit of VLA-2 receptor) (ITGA2, Accession NM_002203), a gene which has roles in blood clotting and angiogenesis, acts as a collagen and laminin receptor. Accordingly, utilities of VGAM2203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA2. The function of ITGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827.Wilms Tumor 1 (WT1, Accession NM_024425) is another VGAM2203 host target gene. WT1 BINDING SITE1 through WT1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WT1 BINDING SITE1 through WT1 BINDING SITE4, designated SEQ ID:23671, SEQ ID:23675, SEQ ID:23667 and SEQ ID:5951 respectively, to the nucleotide sequence of VGAM2203 RNA, herein designated

VGAM RNA, also designated SEQ ID:4914.

[75850] Another function of VGAM2203 is therefore inhibition of Wilms Tumor 1 (WT1, Accession NM_024425). Accordingly, utilities of VGAM2203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WT1. KIAA0993 (Accession XM_034413) is another VGAM2203 host target gene. KIAA0993 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0993 BINDING SITE, designated SEQ ID:32083, to the nucleotide sequence of VGAM2203 RNA, herein designated VGAM RNA, also designated SEQ ID:4914.

[75851] Another function of VGAM2203 is therefore inhibition of KIAA0993 (Accession XM_034413). Accordingly, utilities of VGAM2203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0993. KIAA1416 (Accession XM_098762) is another VGAM2203 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1416, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41797, to the nucleotide sequence of VGAM2203 RNA, herein designated VGAM RNA, also designated SEQ ID:4914.

[75852] Another function of VGAM2203 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM2203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. My015 (Accession XM_039512) is another VGAM2203 host target gene. My015 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by My015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of My015 BINDING SITE, designated SEQ ID:33103, to the nucleotide sequence of VGAM2203 RNA, herein designated VGAM RNA, also designated SEQ ID:4914.

[75853] Another function of VGAM2203 is therefore inhibition of My015 (Accession XM_039512). Accordingly, utilities of VGAM2203 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with My015. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737) is another VGAM2203 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:16388, to the nucleotide sequence of VGAM2203 RNA, herein designated VGAM RNA, also designated SEQ ID:4914.

[75854] Another function of VGAM2203 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737). Accordingly, utilities of VGAM2203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285) is another VGAM2203 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:27101 and SEQ ID:36112 respectively, to the nucleotide sequence of VGAM2203 RNA, herein designated VGAM RNA, also designated SEQ ID:4914.

[75855] Another function of VGAM2203 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285). Accordingly, utilities of VGAM2203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1. LOC157503 (Accession XM_098767) is another VGAM2203 host target gene. LOC157503 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157503 BINDING SITE, designated SEQ ID:41815, to the nucleotide sequence of VGAM2203 RNA, herein designated VGAM RNA, also designated SEQ ID:4914.

[75856] Another function of VGAM2203 is therefore inhibition of LOC157503 (Accession XM_098767). Accordingly, utilities

of VGAM2203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157503. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2204 (VGAM2204) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75857] VGAM2204 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2204 was detected is described hereinabove with reference to Figs. 1-8.

[75858] VGAM2204 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2204 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75859] VGAM2204 gene encodes a VGAM2204 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2204 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2204 precursor RNA is designated SEQ ID:2190, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2190 is located at position 183474 relative to the genome of Cowpox Virus.

[75860] VGAM2204 precursor RNA folds onto itself, forming VGAM2204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75861] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2204 folded precursor RNA into VGAM2204 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2204 RNA is designated SEQ ID:4915, and

is provided hereinbelow with reference to the sequence listing part.

[75862] VGAM2204 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2204 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2204 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75863] VGAM2204 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2204 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2204 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2204 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2204 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75864] The complementary binding of VGAM2204 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2204 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2204 host target RNA into VGAM2204 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75865] It is appreciated that VGAM2204 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2204 host target genes. The mRNA of each one of this plurality of VGAM2204 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2204 RNA, herein designated VGAM RNA, and which when bound by VGAM2204 RNA causes inhibition of translation of respective one or more VGAM2204 host target proteins.

[75866] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2204 gene, herein designated VGAM GENE, on one or more VGAM2204 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75867] It is yet further appreciated that a function of VGAM2204 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2204 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2204 correlate with, and may be deduced from, the identity of the host target genes which VGAM2204 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75868] Nucleotide sequences of the VGAM2204 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2204 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2204 are further described hereinbelow with reference to Table 1.

[75869] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2204 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2204 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75870] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2204 gene, herein designated VGAM is inhibition of expression of VGAM2204 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2204 correlate with, and may be deduced from, the identity of the target genes which VGAM2204 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75871] FLJ20094 (Accession NM_017665) is a VGAM2204 host target gene. FLJ20094 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20094, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20094 BINDING SITE, designated SEQ ID:19207, to the nucleotide sequence of VGAM2204 RNA, herein designated VGAM RNA, also designated SEQ ID:4915.

[75872] A function of VGAM2204 is therefore inhibition of FLJ20094 (Accession NM_017665). Accordingly, utilities of VGAM2204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20094. Tankyrase, TRF1-interacting Ankyrin-related ADP-ribose Polymerase 2 (TNKS2, Accession NM_025235)

is another VGAM2204 host target gene. TNKS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNKS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNKS2 BINDING SITE, designated SEQ ID:24913, to the nucleotide sequence of VGAM2204 RNA, herein designated VGAM RNA, also designated SEQ ID:4915.

[75873] Another function of VGAM2204 is therefore inhibition of Tankyrase, TRF1-interacting Ankyrin-related ADP-ribose Polymerase 2 (TNKS2, Accession NM_025235). Accordingly, utilities of VGAM2204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNKS2. LOC202025 (Accession XM_117353) is another VGAM2204 host target gene. LOC202025 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202025 BINDING SITE, designated SEQ ID:43400, to the nucleotide sequence of VGAM2204 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4915.

[75874] Another function of VGAM2204 is therefore inhibition of LOC202025 (Accession XM_117353). Accordingly, utilities of VGAM2204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202025. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2205 (VGAM2205) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75875] VGAM2205 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2205 was detected is described hereinabove with reference to Figs. 1-8.

[75876] VGAM2205 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2205 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75877] VGAM2205 gene encodes a VGAM2205 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2205 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2205 precursor RNA is designated SEQ ID:2191, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2191 is located at position 188975 relative to the genome of Cowpox Virus.

[75878] VGAM2205 precursor RNA folds onto itself, forming VGAM2205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75879] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2205 folded precursor RNA into VGAM2205 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2205 RNA is designated SEQ ID:4916, and is provided hereinbelow with reference to the sequence listing part.

[75880] VGAM2205 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2205 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2205 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75881] VGAM2205 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2205 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2205 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2205 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2205 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75882] The complementary binding of VGAM2205 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2205 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2205 host target RNA into VGAM2205 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75883] It is appreciated that VGAM2205 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2205 host target genes. The mRNA of

each one of this plurality of VGAM2205 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2205 RNA, herein designated VGAM RNA, and which when bound by VGAM2205 RNA causes inhibition of translation of respective one or more VGAM2205 host target proteins.

[75884] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2205 gene, herein designated VGAM GENE, on one or more VGAM2205 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[75885] It is yet further appreciated that a function of VGAM2205 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2205 correlate with, and may be deduced from, the identity of the host target genes which VGAM2205 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75886] Nucleotide sequences of the VGAM2205 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2205 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2205 are further described hereinbelow with reference to Table 1.

[75887] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2205 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2205 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75888] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2205 gene, herein designated VGAM is inhibition of expression of VGAM2205 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2205 correlate with, and may be deduced from, the identity of the target genes which VGAM2205 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75889] Ankyrin 3, Node of Ranvier (ankyrin G) (ANK3, Accession NM_020987) is a VGAM2205 host target gene. ANK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ANK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK3 BINDING SITE, designated SEQ ID:21984, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75890] A function of VGAM2205 is therefore inhibition of Ankyrin 3, Node of Ranvier (ankyrin G) (ANK3, Accession NM_020987), a gene which plays key roles in activities

such as cell motility, activation, proliferation. Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK3. The function of ANK3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1527.CD2-associated Protein (CD2AP, Accession NM_012120) is another VGAM2205 host target gene. CD2AP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD2AP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD2AP BINDING SITE, designated SEQ ID:14433, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75891] Another function of VGAM2205 is therefore inhibition of CD2-associated Protein (CD2AP, Accession NM_012120), a gene which binds CAS ligand and may therefor involves in its growth regulatory pathway. Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD2AP.

The function of CD2AP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM_004932) is another VGAM2205 host target gene. CDH6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH6 BINDING SITE, designated SEQ ID:11378, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75892] Another function of VGAM2205 is therefore inhibition of Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM_004932), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH6. The function of CDH6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM60.Mitogen-activated Protein Kinase Kinase Kinase 7 (MAP3K7, Accession NM_003188) is another VGAM2205 host target gene. MAP3K7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K7 BINDING SITE, designated SEQ ID:9165, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75893] Another function of VGAM2205 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 7 (MAP3K7, Accession NM_003188), a gene which can phosphorylate and activate yet undefined mapkks. mediator of tgf-beta signal transduction. stimulates nf-kappa b activation. Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K7. The function of MAP3K7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1968.PSA (Accession NM_021154) is another

VGAM2205 host target gene. PSA BINDING SITE1 and PSA BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PSA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSA BINDING SITE1 and PSA BINDING SITE2, designated SEQ ID:22131 and SEQ ID:27740 respectively, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75894] Another function of VGAM2205 is therefore inhibition of PSA (Accession NM_021154), a gene which is puromycin-sensitive aminopeptidase and has metallopeptidase activity. Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSA. The function of PSA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM65.Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFBR3, Accession NM_003243) is another VGAM2205 host target gene. TGFBR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

TGFBR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFBR3 BINDING SITE, designated SEQ ID:9253, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75895] Another function of VGAM2205 is therefore inhibition of Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFBR3, Accession NM_003243), a gene which involves in capturing and retaining TGF-beta for presentation to the signaling receptors. Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR3. The function of TGFBR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM139.FLJ20136 (Accession NM_017684) is another VGAM2205 host target gene. FLJ20136 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ20136 BINDING SITE, designated SEQ ID:19231, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75896] Another function of VGAM2205 is therefore inhibition of FLJ20136 (Accession NM_017684). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20136. IL-23R (Accession NM_144701) is another VGAM2205 host target gene. IL-23R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL-23R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL-23R BINDING SITE, designated SEQ ID:29526, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75897] Another function of VGAM2205 is therefore inhibition of IL-23R (Accession NM_144701). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL-23R. KIAA0007 (Accession XM_087089) is another VGAM2205

host target gene. KIAA0007 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0007 BINDING SITE, designated SEQ ID:39047, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75898] Another function of VGAM2205 is therefore inhibition of KIAA0007 (Accession XM_087089). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0007. MGC5576 (Accession NM_024056) is another VGAM2205 host target gene. MGC5576 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC5576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5576 BINDING SITE, designated SEQ ID:23494, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75899] Another function of VGAM2205 is therefore inhibition of MGC5576 (Accession NM_024056). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5576. Oxysterol Binding Protein-like 5 (OSBPL5, Accession XM_052567) is another VGAM2205 host target gene. OSBPL5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL5 BINDING SITE, designated SEQ ID:35993, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75900] Another function of VGAM2205 is therefore inhibition of Oxysterol Binding Protein-like 5 (OSBPL5, Accession XM_052567). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL5. PEGASUS (Accession NM_022466) is another VGAM2205 host target gene. PEGASUS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

PEGASUS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEGASUS BINDING SITE, designated SEQ ID:22816, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75901] Another function of VGAM2205 is therefore inhibition of PEGASUS (Accession NM_022466). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEGASUS. PURG (Accession NM_013357) is another VGAM2205 host target gene. PURG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PURG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PURG BINDING SITE, designated SEQ ID:15007, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75902] Another function of VGAM2205 is therefore inhibition of PURG (Accession NM_013357). Accordingly, utilities of

VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PURG. SMOC2 (Accession XM_051452) is another VGAM2205 host target gene. SMOC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMOC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMOC2 BINDING SITE, designated SEQ ID:35838, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75903] Another function of VGAM2205 is therefore inhibition of SMOC2 (Accession XM_051452). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOC2. LOC122773 (Accession XM_058665) is another VGAM2205 host target gene. LOC122773 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC122773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC122773 BINDING SITE, designated SEQ ID:36712, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75904] Another function of VGAM2205 is therefore inhibition of LOC122773 (Accession XM_058665). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122773. LOC144305 (Accession XM_096572) is another VGAM2205 host target gene. LOC144305 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144305 BINDING SITE, designated SEQ ID:40402, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75905] Another function of VGAM2205 is therefore inhibition of LOC144305 (Accession XM_096572). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144305. LOC145845 (Accession XM_096884) is another VGAM2205 host target gene. LOC145845 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145845, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145845 BINDING SITE, designated SEQ ID:40617, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75906] Another function of VGAM2205 is therefore inhibition of LOC145845 (Accession XM_096884). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145845. LOC152185 (Accession NM_144718) is another VGAM2205 host target gene. LOC152185 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152185 BINDING SITE, designated SEQ ID:29540, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75907] Another function of VGAM2205 is therefore inhibition of

LOC152185 (Accession NM_144718). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152185. LOC153688 (Accession XM_098416) is another VGAM2205 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:41663, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75908] Another function of VGAM2205 is therefore inhibition of LOC153688 (Accession XM_098416). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688. LOC196527 (Accession XM_113743) is another VGAM2205 host target gene. LOC196527 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC196527 BINDING SITE, designated SEQ ID:42402, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75909] Another function of VGAM2205 is therefore inhibition of LOC196527 (Accession XM_113743). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196527. LOC221271 (Accession XM_166307) is another VGAM2205 host target gene. LOC221271 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221271 BINDING SITE, designated SEQ ID:44128, to the nucleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, also designated SEQ ID:4916.

[75910] Another function of VGAM2205 is therefore inhibition of LOC221271 (Accession XM_166307). Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221271. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2206 (VGAM2206) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75911] VGAM2206 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2206 was detected is described hereinabove with reference to Figs. 1-8.

[75912] VGAM2206 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2206 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75913] VGAM2206 gene encodes a VGAM2206 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2206 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2206 precursor RNA is designated SEQ ID:2192, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2192 is located at position 178296 relative to the genome of Cowpox Virus.

[75914] VGAM2206 precursor RNA folds onto itself, forming VGAM2206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75915] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2206 folded precursor RNA into VGAM2206 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2206 RNA is designated SEQ ID:4917, and is provided hereinbelow with reference to the sequence listing part.

[75916] VGAM2206 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2206 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2206 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75917] VGAM2206 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2206 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2206 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2206 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2206 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75918] The complementary binding of VGAM2206 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2206 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2206 host target RNA into VGAM2206 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75919] It is appreciated that VGAM2206 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2206 host target genes. The mRNA of each one of this plurality of VGAM2206 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2206 RNA, herein designated VGAM RNA, and which when bound by VGAM2206 RNA causes inhibition of translation of respective one or more

VGAM2206 host target proteins.

[75920] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2206 gene, herein designated VGAM GENE, on one or more VGAM2206 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75921] It is yet further appreciated that a function of VGAM2206 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2206 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific

functions, and accordingly utilities, of VGAM2206 correlate with, and may be deduced from, the identity of the host target genes which VGAM2206 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75922] Nucleotide sequences of the VGAM2206 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2206 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2206 are further described hereinbelow with reference to Table 1.

[75923] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2206 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2206 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75924] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2206 gene, herein designated VGAM is inhibition of expression of VGAM2206 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2206 correlate with, and may be deduced from, the identity of the target genes which VGAM2206 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75925] DKFZp434G179 (Accession XM_087065) is a VGAM2206 host target gene. DKFZp434G179 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434G179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434G179 BINDING SITE, designated SEQ ID:39039, to the nucleotide sequence of VGAM2206 RNA, herein designated VGAM RNA, also designated SEQ ID:4917.

[75926] A function of VGAM2206 is therefore inhibition of DKFZp434G179 (Accession XM_087065). Accordingly, utilities of VGAM2206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434G179. ORM1-like 2 (S. cerevisiae) (ORMDL2, Accession NM_014182) is another VGAM2206 host target gene. ORMDL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ORMDL2, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ORMDL2 BINDING SITE, designated SEQ ID:15466, to the nucleotide sequence of VGAM2206 RNA, herein designated VGAM RNA, also designated SEQ ID:4917.

[75927] Another function of VGAM2206 is therefore inhibition of ORM1-like 2 (S. cerevisiae) (ORMDL2, Accession NM_014182). Accordingly, utilities of VGAM2206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ORMDL2. Tubby Homolog (mouse) (TUB, Accession NM_003320) is another VGAM2206 host target gene. TUB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUB BINDING SITE, designated SEQ ID:9321, to the nucleotide sequence of VGAM2206 RNA, herein designated VGAM RNA, also designated SEQ ID:4917.

[75928] Another function of VGAM2206 is therefore inhibition of Tubby Homolog (mouse) (TUB, Accession NM_003320).

Accordingly, utilities of VGAM2206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUB. LOC115265 (Accession XM_055596) is another VGAM2206 host target gene. LOC115265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115265 BINDING SITE, designated SEQ ID:36307, to the nucleotide sequence of VGAM2206 RNA, herein designated VGAM RNA, also designated SEQ ID:4917.

[75929] Another function of VGAM2206 is therefore inhibition of LOC115265 (Accession XM_055596). Accordingly, utilities of VGAM2206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115265. LOC157657 (Accession XM_088352) is another VGAM2206 host target gene. LOC157657 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC157657 BINDING SITE, designated SEQ ID:39624, to the nucleotide sequence of VGAM2206 RNA, herein designated VGAM RNA, also designated SEQ ID:4917.

[75930] Another function of VGAM2206 is therefore inhibition of LOC157657 (Accession XM_088352). Accordingly, utilities of VGAM2206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157657. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2207 (VGAM2207) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75931] VGAM2207 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2207 was detected is described hereinabove with reference to Figs. 1-8.

[75932] VGAM2207 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM2207 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[75933] VGAM2207 gene encodes a VGAM2207 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2207 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2207 precursor RNA is designated SEQ ID:2193, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2193 is located at position 11555 relative to the genome of Myxoma Virus.

[75934] VGAM2207 precursor RNA folds onto itself, forming VGAM2207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75935] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2207 folded precursor RNA into VGAM2207 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2207 RNA is designated SEQ ID:4918, and is provided hereinbelow with reference to the sequence listing part.

[75936] VGAM2207 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2207 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2207 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75937] VGAM2207 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2207 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2207 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2207 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2207 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75938] The complementary binding of VGAM2207 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2207 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2207 host target RNA into VGAM2207 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75939] It is appreciated that VGAM2207 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2207 host target genes. The mRNA of each one of this plurality of VGAM2207 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2207 RNA, herein designated VGAM RNA, and which when bound by VGAM2207 RNA causes inhibition of translation of respective one or more VGAM2207 host target proteins.

[75940] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2207 gene, herein designated VGAM GENE, on one or more VGAM2207 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75941] It is yet further appreciated that a function of VGAM2207 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2207 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM2207 correlate with, and may be deduced from, the identity of the host target genes which VGAM2207 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75942] Nucleotide sequences of the VGAM2207 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2207 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2207 are further described hereinbelow with reference to Table 1.

[75943] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2207 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2207 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75944] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2207 gene, herein designated VGAM is inhibition of expression of VGAM2207 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2207 correlate with, and may be deduced from, the identity of the target genes which VGAM2207 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75945] Poly (ADP-ribose) Glycohydrolase (PARG, Accession NM_003631) is a VGAM2207 host target gene. PARG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PARG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARG BINDING SITE, designated SEQ ID:9693, to the nucleotide sequence of VGAM2207 RNA, herein designated VGAM RNA, also designated SEQ ID:4918.

[75946] A function of VGAM2207 is therefore inhibition of Poly (ADP-ribose) Glycohydrolase (PARG, Accession NM_003631), a gene which is found in many tissues and may be subject to proteolysis generating smaller, active products. Accordingly, utilities of VGAM2207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARG. The function of PARG has been established by previous studies. The synthesis and rapid turnover of ADP-ribose polymers is an immediate cellular response to DNA damage. Once synthesized by PARP (OMIM Ref. No. 173870), polymers are rapidly turned over and converted to free ADP-ribose by the action of poly(ADP-ribose) glycohydrolase (PARG). By PCR with degenerate primers based on the partial protein sequence of bovine PARG, Lin et al. (1997) isolated bovine PARG cDNAs. The protein had a calculated molecular mass of 111 kD, nearly twice the size of the 59-kD enzymatically active PARG isolated from bovine thymus. Using an activity gel assay of extracts from bacteria expressing PARG, the authors determined that cDNA encoded proteins of approximately 115 and 59 kD. The larger protein was sensitive to proteolysis, yielding a protein of approximately 59 kD. The enzymatically active 59-kD PARG cor-

responded to the C-terminal portion of the protein. The authors suggested that proteolysis explains the presence of PARG activity with a molecular mass of approximately 74 and 59 kD in bovine thymus preparations, and previous reports of a 74-kD PARG in guinea pig liver and human placenta. Using the sequence of the bovine cDNA, they searched sequence databases and identified human and rat PARG cDNAs. By fluorescence in situ hybridization, Ame et al. (1999) mapped the PARG gene to human chromosome 10q11.23 and mouse chromosome 14B.

[75947] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[75948] Lin, W.; Ame, J.-C.; Aboul-Ela, N.; Jacobson, E. L.; Jacobson, M. K. : Isolation and characterization of the cDNA encoding bovine poly(ADP-ribose) glycohydrolase. J. Biol. Chem. 272: 11895-11901, 1997. ; and

[75949] Ame, J.-C.; Apiou, F.; Jacobson, E. L.; Jacobson, M. K. : Assignment of the poly(ADP-ribose) glycohydrolase gene (PARG) to human chromosome 10q11.23 and mouse chromosome 14B by in situ.

[75950] Further studies establishing the function and utilities of PARG are found in John Hopkins OMIM database record ID

603501, and in sited publications numbered 7988-7989 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Suppression of Tumorigenicity 7 (ST7, Accession NM_021908) is another VGAM2207 host target gene. ST7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ST7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7 BINDING SITE, designated SEQ ID:22433, to the nucleotide sequence of VGAM2207 RNA, herein designated VGAM RNA, also designated SEQ ID:4918.

[75951] Another function of VGAM2207 is therefore inhibition of Suppression of Tumorigenicity 7 (ST7, Accession NM_021908), a gene which has a role in regulating cell-environment or cell-cell interactions. Accordingly, utilities of VGAM2207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7. The function of ST7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107.BMF (Accession NM_033503) is another

VGAM2207 host target gene. BMF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BMF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMF BINDING SITE, designated SEQ ID:27284, to the nucleotide sequence of VGAM2207 RNA, herein designated VGAM RNA, also designated SEQ ID:4918.

[75952] Another function of VGAM2207 is therefore inhibition of BMF (Accession NM_033503). Accordingly, utilities of VGAM2207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMF. FLJ11274 (Accession NM_018375) is another VGAM2207 host target gene. FLJ11274 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11274 BINDING SITE, designated SEQ ID:20402, to the nucleotide sequence of VGAM2207 RNA, herein designated VGAM RNA, also designated SEQ ID:4918.

[75953] Another function of VGAM2207 is therefore inhibition of FLJ11274 (Accession NM_018375). Accordingly, utilities of VGAM2207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11274. FLJ20457 (Accession NM_017832) is another VGAM2207 host target gene. FLJ20457 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20457 BINDING SITE, designated SEQ ID:19498, to the nucleotide sequence of VGAM2207 RNA, herein designated VGAM RNA, also designated SEQ ID:4918.

[75954] Another function of VGAM2207 is therefore inhibition of FLJ20457 (Accession NM_017832). Accordingly, utilities of VGAM2207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20457. KIAA1165 (Accession XM_041162) is another VGAM2207 host target gene. KIAA1165 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1165, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1165 BINDING SITE, designated SEQ ID:33479, to the nucleotide sequence of VGAM2207 RNA, herein designated VGAM RNA, also designated SEQ ID:4918.

[75955] Another function of VGAM2207 is therefore inhibition of KIAA1165 (Accession XM_041162). Accordingly, utilities of VGAM2207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1165. Mitochondrial Ribosomal Protein L13 (MRPL13, Accession NM_014078) is another VGAM2207 host target gene. MRPL13 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MRPL13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL13 BINDING SITE, designated SEQ ID:15305, to the nucleotide sequence of VGAM2207 RNA, herein designated VGAM RNA, also designated SEQ ID:4918.

[75956] Another function of VGAM2207 is therefore inhibition of Mitochondrial Ribosomal Protein L13 (MRPL13, Accession NM_014078). Accordingly, utilities of VGAM2207 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL13. LOC220565 (Accession XM_165417) is another VGAM2207 host target gene. LOC220565 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220565 BINDING SITE, designated SEQ ID:43636, to the nucleotide sequence of VGAM2207 RNA, herein designated VGAM RNA, also designated SEQ ID:4918.

[75957] Another function of VGAM2207 is therefore inhibition of LOC220565 (Accession XM_165417). Accordingly, utilities of VGAM2207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220565. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2208 (VGAM2208) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75958] VGAM2208 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2208 was detected is described hereinabove with reference to Figs. 1-8.

[75959] VGAM2208 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM2208 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75960] VGAM2208 gene encodes a VGAM2208 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2208 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2208 precursor RNA is designated SEQ ID:2194, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2194 is located at position 21539 relative to the genome of Myxoma Virus.

[75961] VGAM2208 precursor RNA folds onto itself, forming VGAM2208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75962] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2208 folded precursor RNA into VGAM2208 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2208 RNA is designated SEQ ID:4919, and is provided hereinbelow with reference to the sequence listing part.

[75963] VGAM2208 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2208 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2208 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[75964] VGAM2208 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2208 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2208 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2208 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2208 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75965] The complementary binding of VGAM2208 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2208 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2208 host target RNA into VGAM2208 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75966] It is appreciated that VGAM2208 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2208 host target genes. The mRNA of each one of this plurality of VGAM2208 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2208 RNA, herein designated VGAM RNA, and which when bound by VGAM2208 RNA causes inhibition of translation of respective one or more VGAM2208 host target proteins.

[75967] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2208 gene, herein designated VGAM GENE, on one or more VGAM2208 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75968] It is yet further appreciated that a function of VGAM2208 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2208 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM2208 correlate with, and may be deduced from, the identity of the host target genes which VGAM2208 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[75969] Nucleotide sequences of the VGAM2208 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2208 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2208 are further described hereinbelow with reference to Table 1.

[75970] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2208 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2208 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75971] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2208 gene, herein designated VGAM is inhibition of expression of VGAM2208 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2208 correlate with, and may be deduced from, the identity of the target genes which VGAM2208 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75972] Potassium Channel, Subfamily K, Member 1 (KCNK1, Accession NM_002245) is a VGAM2208 host target gene.

KCNK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK1 BINDING SITE, designated SEQ ID:8032, to the nucleotide sequence of VGAM2208 RNA, herein designated VGAM RNA, also designated SEQ ID:4919.

[75973] A function of VGAM2208 is therefore inhibition of Potassium Channel, Subfamily K, Member 1 (KCNK1, Accession NM_002245), a gene which is an inward rectifying potassium channel. Accordingly, utilities of VGAM2208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK1. The function of KCNK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2209 (VGAM2209) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[75974] VGAM2209 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2209 was detected is described hereinabove with reference to Figs. 1-8.

[75975] VGAM2209 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM2209 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75976] VGAM2209 gene encodes a VGAM2209 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2209 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2209 precursor RNA is designated SEQ ID:2195, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2195 is located at position 1250 relative to the genome of Myxoma Virus.

[75977] VGAM2209 precursor RNA folds onto itself, forming VGAM2209 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75978] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2209 folded precursor RNA into VGAM2209 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2209 RNA is designated SEQ ID:4920, and is provided hereinbelow with reference to the sequence listing part.

[75979] VGAM2209 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2209 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2209 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75980] VGAM2209 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2209 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2209 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2209 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2209 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75981] The complementary binding of VGAM2209 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2209 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2209 host target RNA into VGAM2209 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75982] It is appreciated that VGAM2209 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2209 host target genes. The mRNA of each one of this plurality of VGAM2209 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2209 RNA, herein designated VGAM RNA, and which when bound by VGAM2209 RNA causes inhibition of translation of respective one or more VGAM2209 host target proteins.

[75983] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2209 gene, herein designated VGAM GENE, on one or more VGAM2209 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[75984] It is yet further appreciated that a function of VGAM2209 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2209 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM2209 correlate with, and may be deduced from, the identity of the host target genes which VGAM2209 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[75985] Nucleotide sequences of the VGAM2209 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2209 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2209 are further described hereinbelow with reference to Table 1.

[75986] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2209 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2209 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[75987] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2209 gene, herein designated VGAM is inhibition of expression of VGAM2209 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2209 correlate with, and may be deduced from, the identity of the target genes which VGAM2209 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[75988] FLJ10620 (Accession NM_018157) is a VGAM2209 host target gene. FLJ10620 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10620 BINDING SITE, designated SEQ ID:19973, to the nucleotide sequence of VGAM2209 RNA, herein designated VGAM RNA, also designated SEQ ID:4920.

[75989] A function of VGAM2209 is therefore inhibition of FLJ10620 (Accession NM_018157). Accordingly, utilities of VGAM2209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10620. FLJ25415 (Accession NM_144708) is another VGAM2209 host target gene. FLJ25415 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ25415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ25415 BINDING SITE, designated SEQ ID:29535, to the nucleotide sequence of VGAM2209 RNA, herein designated VGAM

RNA, also designated SEQ ID:4920.

[75990] Another function of VGAM2209 is therefore inhibition of FLJ25415 (Accession NM_144708). Accordingly, utilities of VGAM2209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25415. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2210 (VGAM2210) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[75991] VGAM2210 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2210 was detected is described hereinabove with reference to Figs. 1-8.

[75992] VGAM2210 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM2210 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[75993] VGAM2210 gene encodes a VGAM2210 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2210 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2210 precursor RNA is designated SEQ ID:2196, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2196 is located at position 12338 relative to the genome of Myxoma Virus.

[75994] VGAM2210 precursor RNA folds onto itself, forming VGAM2210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[75995] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2210 folded precursor RNA into VGAM2210 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2210 RNA is designated SEQ ID:4921, and is provided hereinbelow with reference to the sequence listing part.

[75996] VGAM2210 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2210 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2210 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[75997] VGAM2210 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2210 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2210 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2210 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2210 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[75998] The complementary binding of VGAM2210 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2210 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2210 host target RNA into VGAM2210 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[75999] It is appreciated that VGAM2210 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2210 host target genes. The mRNA of

each one of this plurality of VGAM2210 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2210 RNA, herein designated VGAM RNA, and which when bound by VGAM2210 RNA causes inhibition of translation of respective one or more VGAM2210 host target proteins.

[76000] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2210 gene, herein designated VGAM GENE, on one or more VGAM2210 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[76001] It is yet further appreciated that a function of VGAM2210 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2210 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM2210 correlate with, and may be deduced from, the identity of the host target genes which VGAM2210 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76002] Nucleotide sequences of the VGAM2210 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2210 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2210 are further described hereinbelow with reference to Table 1.

[76003] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2210 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2210 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76004] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2210 gene, herein designated VGAM is inhibition of expression of VGAM2210 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2210 correlate with, and may be deduced from, the identity of the target genes which VGAM2210 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76005] Tumor Necrosis Factor (ligand) Superfamily, Member 15 (TNFSF15, Accession NM_005118) is a VGAM2210 host target gene. TNFSF15 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TNFSF15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF15 BINDING SITE, designated SEQ ID:11600, to the nucleotide sequence of VGAM2210 RNA, herein designated VGAM RNA, also designated SEQ ID:4921.

[76006] A function of VGAM2210 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 15

(TNFSF15, Accession NM_005118), a gene which acts as an autocrine factor to induce apoptosis in endothelial cells. Accordingly, utilities of VGAM2210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF15. The function of TNFSF15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM350.KIAA1497 (Accession XM_041431) is another VGAM2210 host target gene. KIAA1497 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1497 BINDING SITE, designated SEQ ID:33525, to the nucleotide sequence of VGAM2210 RNA, herein designated VGAM RNA, also designated SEQ ID:4921.

[76007] Another function of VGAM2210 is therefore inhibition of KIAA1497 (Accession XM_041431). Accordingly, utilities of VGAM2210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1497. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2211 (VGAM2211) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76008] VGAM2211 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2211 was detected is described hereinabove with reference to Figs. 1-8.

[76009] VGAM2211 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM2211 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76010] VGAM2211 gene encodes a VGAM2211 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2211 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2211 precursor RNA is designated SEQ ID:2197, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2197 is located at position 17880 relative to the genome of Myxoma Virus.

[76011] VGAM2211 precursor RNA folds onto itself, forming VGAM2211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76012] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2211 folded precursor RNA into VGAM2211 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2211 RNA is designated SEQ ID:4922, and is provided hereinbelow with reference to the sequence listing part.

[76013] VGAM2211 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2211 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2211 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76014] VGAM2211 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2211 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2211 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2211 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2211 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76015] The complementary binding of VGAM2211 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2211 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2211 host target RNA into VGAM2211 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76016] It is appreciated that VGAM2211 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2211 host target genes. The mRNA of each one of this plurality of VGAM2211 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2211 RNA, herein designated VGAM RNA, and which when bound by VGAM2211 RNA causes inhibition of translation of respective one or more

VGAM2211 host target proteins.

[76017] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2211 gene, herein designated VGAM GENE, on one or more VGAM2211 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76018] It is yet further appreciated that a function of VGAM2211 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2211 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific

functions, and accordingly utilities, of VGAM2211 correlate with, and may be deduced from, the identity of the host target genes which VGAM2211 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76019] Nucleotide sequences of the VGAM2211 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2211 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2211 are further described hereinbelow with reference to Table 1.

[76020] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2211 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2211 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76021] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2211 gene, herein designated VGAM is inhibition of expression of VGAM2211 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2211 correlate with, and may be deduced from, the identity of the target genes which VGAM2211 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76022] Contactin 2 (axonal) (CNTN2, Accession NM_005076) is a VGAM2211 host target gene. CNTN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTN2 BINDING SITE, designated SEQ ID:11527, to the nucleotide sequence of VGAM2211 RNA, herein designated VGAM RNA, also designated SEQ ID:4922.

[76023] A function of VGAM2211 is therefore inhibition of Contactin 2 (axonal) (CNTN2, Accession NM_005076), a gene which may play a role in axonal growth and cell adhesion. Accordingly, utilities of VGAM2211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTN2. The function of CNTN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM259.DKFZP566I1024 (Accession XM_046506) is another VGAM2211 host target gene. DKFZP566I1024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP566I1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566I1024 BINDING SITE, designated SEQ ID:34734, to the nucleotide sequence of VGAM2211 RNA, herein designated VGAM RNA, also designated SEQ ID:4922.

[76024] Another function of VGAM2211 is therefore inhibition of DKFZP566I1024 (Accession XM_046506). Accordingly, utilities of VGAM2211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566I1024. FLJ12078 (Accession NM_024977) is another VGAM2211 host target gene. FLJ12078 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12078 BINDING SITE, designated SEQ ID:24536, to the

nucleotide sequence of VGAM2211 RNA, herein designated VGAM RNA, also designated SEQ ID:4922.

[76025] Another function of VGAM2211 is therefore inhibition of FLJ12078 (Accession NM_024977). Accordingly, utilities of VGAM2211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12078. GK001 (Accession NM_020198) is another VGAM2211 host target gene. GK001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GK001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GK001 BINDING SITE, designated SEQ ID:21430, to the nucleotide sequence of VGAM2211 RNA, herein designated VGAM RNA, also designated SEQ ID:4922.

[76026] Another function of VGAM2211 is therefore inhibition of GK001 (Accession NM_020198). Accordingly, utilities of VGAM2211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GK001. SCIN (Accession NM_033128) is another VGAM2211 host target gene. SCIN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by SCIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCIN BINDING SITE, designated SEQ ID:26972, to the nucleotide sequence of VGAM2211 RNA, herein designated VGAM RNA, also designated SEQ ID:4922.

[76027] Another function of VGAM2211 is therefore inhibition of SCIN (Accession NM_033128). Accordingly, utilities of VGAM2211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCIN. Zinc Finger Protein 323 (ZNF323, Accession NM_030899) is another VGAM2211 host target gene. ZNF323 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF323 BINDING SITE, designated SEQ ID:25167, to the nucleotide sequence of VGAM2211 RNA, herein designated VGAM RNA, also designated SEQ ID:4922.

[76028] Another function of VGAM2211 is therefore inhibition of Zinc Finger Protein 323 (ZNF323, Accession NM_030899).

Accordingly, utilities of VGAM2211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF323. LOC152925 (Accession XM_087559) is another VGAM2211 host target gene. LOC152925 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152925 BINDING SITE, designated SEQ ID:39337, to the nucleotide sequence of VGAM2211 RNA, herein designated VGAM RNA, also designated SEQ ID:4922.

[76029] Another function of VGAM2211 is therefore inhibition of LOC152925 (Accession XM_087559). Accordingly, utilities of VGAM2211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152925. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2212 (VGAM2212) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[76030] VGAM2212 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2212 was detected is described hereinabove with reference to Figs. 1-8.

[76031] VGAM2212 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM2212 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76032] VGAM2212 gene encodes a VGAM2212 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2212 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2212 precursor RNA is designated SEQ ID:2198, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2198 is located at position 11366 relative to the genome of Myxoma Virus.

[76033] VGAM2212 precursor RNA folds onto itself, forming VGAM2212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76034] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2212 folded precursor RNA into VGAM2212 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2212 RNA is designated SEQ ID:4923, and is provided hereinbelow with reference to the sequence listing part.

[76035] VGAM2212 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2212 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2212 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76036] VGAM2212 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2212 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2212 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2212 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2212 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[76037] The complementary binding of VGAM2212 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2212 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2212 host target RNA into VGAM2212 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76038] It is appreciated that VGAM2212 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2212 host target genes. The mRNA of each one of this plurality of VGAM2212 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2212 RNA, herein designated VGAM RNA, and which when bound by VGAM2212 RNA causes inhibition of translation of respective one or more VGAM2212 host target proteins.

[76039] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2212 gene, herein designated VGAM GENE, on one

or more VGAM2212 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76040] It is yet further appreciated that a function of VGAM2212 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2212 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM2212 correlate with, and may be deduced from, the identity of the host target genes which VGAM2212 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76041] Nucleotide sequences of the VGAM2212 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2212 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2212 are further described hereinbelow with reference to Table 1.

[76042] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2212 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2212 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76043] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2212 gene, herein designated VGAM is inhibition of expression of VGAM2212 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2212 correlate with, and may be deduced from, the identity of the target genes which VGAM2212 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76044] Protein Kinase, CAMP-dependent, Regulatory, Type II, Al-

pha (PRKAR2A, Accession NM_004157) is a VGAM2212 host target gene. PRKAR2A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRKAR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAR2A BINDING SITE, designated SEQ ID:10370, to the nucleotide sequence of VGAM2212 RNA, herein designated VGAM RNA, also designated SEQ ID:4923.

[76045] A function of VGAM2212 is therefore inhibition of Protein Kinase, CAMP-dependent, Regulatory, Type II, Alpha (PRKAR2A, Accession NM_004157), a gene which mediates membrane association by binding to anchoring proteins, including the map2 kinase. Accordingly, utilities of VGAM2212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAR2A. The function of PRKAR2A has been established by previous studies. See 188830. Phosphorylation by cAMP-dependent protein kinases is essential for sperm motility. A cAMP-dependent protein kinase is bound to sperm flagella by a regulatory subunit (RII). Oyen et al. (1989) observed high testis-specific expression of a hu-

man homolog to the rat RII-alpha mRNA induced in haploid germ cells. They cloned a human cDNA that encodes a 404-amino acid polypeptide with a region (amino acids 45-75) divergent from that of the previously published mouse and rat sequences. By PCR and Southern blot analysis of somatic cell hybrid mapping panels and by radiation hybrid analysis, Tasken et al. (1998) mapped the PRKAR2A gene to chromosome 3p21.3-p21.2.

[76046] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[76047] Oyen, O.; Myklebust, F.; Scott, J. D.; Hansson, V.; Jahnsen, T. : Human testis cDNA for the regulatory subunit RII alpha of cAMP-dependent protein kinase encodes an alternate amino-terminal region. FEBS Lett. 246: 57-64, 1989. ; and

[76048] Tasken, K.; Naylor, S. L.; Solberg, R.; Jahnsen, T. : Mapping of the gene encoding the regulatory subunit RII-alpha of cAMP-dependent protein kinase (locus PRKAR2A) to human chromosome r.

[76049] Further studies establishing the function and utilities of PRKAR2A are found in John Hopkins OMIM database record ID 176910, and in sited publications numbered

1154-1155 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2213 (VGAM2213) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76050] VGAM2213 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2213 was detected is described hereinabove with reference to Figs. 1-8.

[76051] VGAM2213 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM2213 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76052] VGAM2213 gene encodes a VGAM2213 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2213 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2213 precursor RNA is desig-

nated SEQ ID:2199, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2199 is located at position 12976 relative to the genome of Myxoma Virus.

[76053] VGAM2213 precursor RNA folds onto itself, forming VGAM2213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76054] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2213 folded precursor RNA into VGAM2213 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM2213 RNA is designated SEQ ID:4924, and is provided hereinbelow with reference to the sequence

listing part.

[76055] VGAM2213 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2213 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2213 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76056] VGAM2213 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2213 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2213 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2213 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2213 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76057] The complementary binding of VGAM2213 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2213 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2213 host target RNA into VGAM2213 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76058] It is appreciated that VGAM2213 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2213 host target genes. The mRNA of each one of this plurality of VGAM2213 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2213 RNA, herein designated VGAM

RNA, and which when bound by VGAM2213 RNA causes inhibition of translation of respective one or more VGAM2213 host target proteins.

[76059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2213 gene, herein designated VGAM GENE, on one or more VGAM2213 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76060] It is yet further appreciated that a function of VGAM2213 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2213 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM2213 correlate with, and may be deduced from, the identity of the host target genes which VGAM2213 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76061] Nucleotide sequences of the VGAM2213 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2213 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2213 are further described hereinbelow with reference to Table 1.

[76062] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2213 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2213 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76063] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2213 gene, herein designated VGAM is

inhibition of expression of VGAM2213 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2213 correlate with, and may be deduced from, the identity of the target genes which VGAM2213 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76064] Extracellular Matrix Protein 2, Female Organ and Adipocyte Specific (ECM2, Accession NM_001393) is a VGAM2213 host target gene. ECM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ECM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ECM2 BINDING SITE, designated SEQ ID:7088, to the nucleotide sequence of VGAM2213 RNA, herein designated VGAM RNA, also designated SEQ ID:4924.

[76065] A function of VGAM2213 is therefore inhibition of Extracellular Matrix Protein 2, Female Organ and Adipocyte Specific (ECM2, Accession NM_001393). Accordingly, utilities of VGAM2213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ECM2. PR Domain Containing 2, with ZNF Domain

(PRDM2, Accession NM_012231) is another VGAM2213 host target gene. PRDM2 BINDING SITE1 and PRDM2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PRDM2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE1 and PRDM2 BINDING SITE2, designated SEQ ID:14536 and SEQ ID:18006 respectively, to the nucleotide sequence of VGAM2213 RNA, herein designated VGAM RNA, also designated SEQ ID:4924.

[76066] Another function of VGAM2213 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_012231), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM2213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.FLJ10139 (Accession NM_018005) is another VGAM2213 host target gene. FLJ10139 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10139 BINDING SITE, designated SEQ ID:19736, to the nucleotide sequence of VGAM2213 RNA, herein designated VGAM RNA, also designated SEQ ID:4924.

[76067] Another function of VGAM2213 is therefore inhibition of FLJ10139 (Accession NM_018005). Accordingly, utilities of VGAM2213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10139. KIAA1165 (Accession XM_041162) is another VGAM2213 host target gene. KIAA1165 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1165, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1165 BINDING SITE, designated SEQ ID:33475, to the nucleotide sequence of VGAM2213 RNA, herein designated VGAM RNA, also designated SEQ ID:4924.

[76068] Another function of VGAM2213 is therefore inhibition of

KIAA1165 (Accession XM_041162). Accordingly, utilities of VGAM2213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1165. mPA-PLA1 (Accession NM_139248) is another VGAM2213 host target gene. mPA-PLA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by mPA-PLA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of mPA-PLA1 BINDING SITE, designated SEQ ID:29250, to the nucleotide sequence of VGAM2213 RNA, herein designated VGAM RNA, also designated SEQ ID:4924.

[76069] Another function of VGAM2213 is therefore inhibition of mPA-PLA1 (Accession NM_139248). Accordingly, utilities of VGAM2213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with mPA-PLA1. MTCH1 (Accession NM_014341) is another VGAM2213 host target gene. MTCH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTCH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of MTCH1 BINDING SITE, designated SEQ ID:15661, to the nucleotide sequence of VGAM2213 RNA, herein designated VGAM RNA, also designated SEQ ID:4924.

[76070] Another function of VGAM2213 is therefore inhibition of MTCH1 (Accession NM_014341). Accordingly, utilities of VGAM2213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTCH1. LOC158364 (Accession XM_088546) is another VGAM2213 host target gene. LOC158364 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158364 BINDING SITE, designated SEQ ID:39817, to the nucleotide sequence of VGAM2213 RNA, herein designated VGAM RNA, also designated SEQ ID:4924.

[76071] Another function of VGAM2213 is therefore inhibition of LOC158364 (Accession XM_088546). Accordingly, utilities of VGAM2213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158364. LOC221773 (Accession XM_165802) is an-

other VGAM2213 host target gene. LOC221773 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221773 BINDING SITE, designated SEQ ID:43760, to the nucleotide sequence of VGAM2213 RNA, herein designated VGAM RNA, also designated SEQ ID:4924.

[76072] Another function of VGAM2213 is therefore inhibition of LOC221773 (Accession XM_165802). Accordingly, utilities of VGAM2213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221773. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2214 (VGAM2214) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76073] VGAM2214 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2214 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[76074] VGAM2214 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM2214 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76075] VGAM2214 gene encodes a VGAM2214 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2214 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2214 precursor RNA is designated SEQ ID:2200, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2200 is located at position 20836 relative to the genome of Myxoma Virus.

[76076] VGAM2214 precursor RNA folds onto itself, forming VGAM2214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76077] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2214 folded precursor RNA into VGAM2214 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2214 RNA is designated SEQ ID:4925, and is provided hereinbelow with reference to the sequence listing part.

[76078] VGAM2214 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2214 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2214 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76079] VGAM2214 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2214 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2214 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2214 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2214 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76080] The complementary binding of VGAM2214 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2214 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2214 host target RNA into VGAM2214 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76081] It is appreciated that VGAM2214 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2214 host target genes. The mRNA of each one of this plurality of VGAM2214 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2214 RNA, herein designated VGAM RNA, and which when bound by VGAM2214 RNA causes inhibition of translation of respective one or more VGAM2214 host target proteins.

[76082] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2214 gene, herein designated VGAM GENE, on one or more VGAM2214 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76083] It is yet further appreciated that a function of VGAM2214 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2214 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM2214 correlate with, and may be deduced from, the identity of the host target genes which VGAM2214 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76084] Nucleotide sequences of the VGAM2214 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2214 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2214 are further described hereinbelow with reference to Table 1.

[76085] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2214 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2214 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76086] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2214 gene, herein designated VGAM is inhibition of expression of VGAM2214 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2214 correlate with, and may be deduced from, the identity of the target genes which VGAM2214 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76087] ATP Synthase, H+ Transporting, Mitochondrial F1 Complex, Beta Polypeptide (ATP5B, Accession XM_006710) is a VGAM2214 host target gene. ATP5B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ATP5B, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP5B BINDING SITE, designated SEQ ID:30008, to the nucleotide sequence of VGAM2214 RNA, herein designated VGAM RNA, also designated SEQ ID:4925.

[76088] A function of VGAM2214 is therefore inhibition of ATP Synthase, H+ Transporting, Mitochondrial F1 Complex, Beta Polypeptide (ATP5B, Accession XM_006710). Accordingly, utilities of VGAM2214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP5B. Retinoschisis (X-linked, juvenile) 1 (RS1, Accession NM_000330) is another VGAM2214 host target gene. RS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RS1 BINDING SITE, designated SEQ ID:5877, to the nucleotide sequence of VGAM2214 RNA, herein designated VGAM RNA, also designated SEQ ID:4925.

[76089] Another function of VGAM2214 is therefore inhibition of Retinoschisis (X-linked, juvenile) 1 (RS1, Accession

NM_000330). Accordingly, utilities of VGAM2214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RS1. ADP-ribosylation Factor Domain Protein 1, 64kDa (ARFD1, Accession NM_001656) is another VGAM2214 host target gene. ARFD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARFD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARFD1 BINDING SITE, designated SEQ ID:7372, to the nucleotide sequence of VGAM2214 RNA, herein designated VGAM RNA, also designated SEQ ID:4925.

[76090] Another function of VGAM2214 is therefore inhibition of ADP-ribosylation Factor Domain Protein 1, 64kDa (ARFD1, Accession NM_001656). Accordingly, utilities of VGAM2214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARFD1. FLJ20666 (Accession NM_017922) is another VGAM2214 host target gene. FLJ20666 BINDING SITE1 and FLJ20666 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20666, cor-

responding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20666 BINDING SITE1 and FLJ20666 BINDING SITE2, designated SEQ ID:19586 and SEQ ID:20337 respectively, to the nucleotide sequence of VGAM2214 RNA, herein designated VGAM RNA, also designated SEQ ID:4925.

[76091] Another function of VGAM2214 is therefore inhibition of FLJ20666 (Accession NM_017922). Accordingly, utilities of VGAM2214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20666. Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM_017971) is another VGAM2214 host target gene. MRPL20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPL20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL20 BINDING SITE, designated SEQ ID:19701, to the nucleotide sequence of VGAM2214 RNA, herein designated VGAM RNA, also designated SEQ ID:4925.

[76092] Another function of VGAM2214 is therefore inhibition of

Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM_017971). Accordingly, utilities of VGAM2214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL20. Phosphatase, Orphan 1 (phospho1, Accession XM_091572) is another VGAM2214 host target gene. phospho1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by phospho1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of phospho1 BINDING SITE, designated SEQ ID:40058, to the nucleotide sequence of VGAM2214 RNA, herein designated VGAM RNA, also designated SEQ ID:4925.

[76093] Another function of VGAM2214 is therefore inhibition of Phosphatase, Orphan 1 (phospho1, Accession XM_091572). Accordingly, utilities of VGAM2214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with phospho1. Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872) is another VGAM2214 host target gene. UNC5D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UNC5D, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5D BINDING SITE, designated SEQ ID:28118, to the nucleotide sequence of VGAM2214 RNA, herein designated VGAM RNA, also designated SEQ ID:4925.

[76094] Another function of VGAM2214 is therefore inhibition of Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872). Accordingly, utilities of VGAM2214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5D. LOC130639 (Accession XM_059464) is another VGAM2214 host target gene. LOC130639 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC130639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130639 BINDING SITE, designated SEQ ID:37003, to the nucleotide sequence of VGAM2214 RNA, herein designated VGAM RNA, also designated SEQ ID:4925.

[76095] Another function of VGAM2214 is therefore inhibition of LOC130639 (Accession XM_059464). Accordingly, utilities

of VGAM2214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130639. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2215 (VGAM2215) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76096] VGAM2215 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2215 was detected is described hereinabove with reference to Figs. 1-8.

[76097] VGAM2215 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2215 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76098] VGAM2215 gene encodes a VGAM2215 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2215 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2215 precursor RNA is designated SEQ ID:2201, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2201 is located at position 9138 relative to the genome of Ectromelia Virus.

[76099] VGAM2215 precursor RNA folds onto itself, forming VGAM2215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76100] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2215 folded precursor RNA into VGAM2215 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2215 RNA is designated SEQ ID:4926, and

is provided hereinbelow with reference to the sequence listing part.

[76101] VGAM2215 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2215 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2215 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76102] VGAM2215 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2215 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2215 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2215 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2215 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76103] The complementary binding of VGAM2215 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2215 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2215 host target RNA into VGAM2215 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76104] It is appreciated that VGAM2215 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2215 host target genes. The mRNA of each one of this plurality of VGAM2215 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2215 RNA, herein designated VGAM RNA, and which when bound by VGAM2215 RNA causes inhibition of translation of respective one or more VGAM2215 host target proteins.

[76105] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2215 gene, herein designated VGAM GENE, on one or more VGAM2215 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76106] It is yet further appreciated that a function of VGAM2215 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2215 correlate with, and may be deduced from, the identity of the host target genes which VGAM2215 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76107] Nucleotide sequences of the VGAM2215 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2215 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2215 are further described hereinbelow with reference to Table 1.

[76108] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2215 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2215 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76109] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2215 gene, herein designated VGAM is inhibition of expression of VGAM2215 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2215 correlate with, and may be deduced from, the identity of the target genes which VGAM2215 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76110] Adrenergic, Beta, Receptor Kinase 2 (ADRBK2, Accession NM_005160) is a VGAM2215 host target gene. ADRBK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADRBK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRBK2 BINDING SITE, designated SEQ ID:11641, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76111] A function of VGAM2215 is therefore inhibition of Adrenergic, Beta, Receptor Kinase 2 (ADRBK2, Accession NM_005160), a gene which regulates desensitization of G protein-coupled receptors. Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ADRBK2. The function of ADRBK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM806.EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838) is another VGAM2215 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41872, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76112] Another function of VGAM2215 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Poly (ADP-ribose) Glycohydrolase (PARG, Accession NM_003631) is another VGAM2215 host target gene. PARG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by PARG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARG BINDING SITE, designated SEQ ID:9692, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76113] Another function of VGAM2215 is therefore inhibition of Poly (ADP-ribose) Glycohydrolase (PARG, Accession NM_003631), a gene which is found in many tissues and may be subject to proteolysis generating smaller, active products. Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARG. The function of PARG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2207.Protein Kinase C, Nu (PRKCN, Accession NM_005813) is another VGAM2215 host target gene. PRKCN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of PRKCN BINDING SITE, designated SEQ ID:12394, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76114] Another function of VGAM2215 is therefore inhibition of Protein Kinase C, Nu (PRKCN, Accession NM_005813). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCN. Runt-related Transcription Factor 3 (RUNX3, Accession NM_004350) is another VGAM2215 host target gene. RUNX3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RUNX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX3 BINDING SITE, designated SEQ ID:10546, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76115] Another function of VGAM2215 is therefore inhibition of Runt-related Transcription Factor 3 (RUNX3, Accession NM_004350), a gene which binds to the core site, 5'-pygpyggt-3', of a number of enhancers and promoters.

Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX3. The function of RUNX3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151.FLJ20004 (Accession XM_170889) is another VGAM2215 host target gene. FLJ20004 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20004 BINDING SITE, designated SEQ ID:45642, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76116] Another function of VGAM2215 is therefore inhibition of FLJ20004 (Accession XM_170889). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20004. HTCD37 (Accession XM_041884) is another VGAM2215 host target gene. HTCD37 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by HTCD37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTCD37 BINDING SITE, designated SEQ ID:33616, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76117] Another function of VGAM2215 is therefore inhibition of HTCD37 (Accession XM_041884). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTCD37. KIAA0841 (Accession XM_049237) is another VGAM2215 host target gene. KIAA0841 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:35357, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76118] Another function of VGAM2215 is therefore inhibition of KIAA0841 (Accession XM_049237). Accordingly, utilities

of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841. KIAA0855 (Accession NM_015003) is another VGAM2215 host target gene. KIAA0855 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0855 BINDING SITE, designated SEQ ID:17371, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76119] Another function of VGAM2215 is therefore inhibition of KIAA0855 (Accession NM_015003). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0855. KIAA1843 (Accession XM_030838) is another VGAM2215 host target gene. KIAA1843 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1843, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1843 BINDING SITE, designated SEQ ID:31160, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76120] Another function of VGAM2215 is therefore inhibition of KIAA1843 (Accession XM_030838). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1843. MGC2827 (Accession NM_023940) is another VGAM2215 host target gene. MGC2827 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2827 BINDING SITE, designated SEQ ID:23423, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76121] Another function of VGAM2215 is therefore inhibition of MGC2827 (Accession NM_023940). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2827. NXP-2 (Accession XM_048706) is another VGAM2215 host target gene. NXP-2 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by NXP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXP-2 BINDING SITE, designated SEQ ID:35228, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76122] Another function of VGAM2215 is therefore inhibition of NXP-2 (Accession XM_048706). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXP-2. LOC148809 (Accession XM_086325) is another VGAM2215 host target gene. LOC148809 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148809, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148809 BINDING SITE, designated SEQ ID:38591, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76123] Another function of VGAM2215 is therefore inhibition of

LOC148809 (Accession XM_086325). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148809. LOC153387 (Accession XM_098369) is another VGAM2215 host target gene. LOC153387 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153387 BINDING SITE, designated SEQ ID:41633, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76124] Another function of VGAM2215 is therefore inhibition of LOC153387 (Accession XM_098369). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153387. LOC169225 (Accession XM_108531) is another VGAM2215 host target gene. LOC169225 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC169225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC169225 BINDING SITE, designated SEQ ID:42203, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76125] Another function of VGAM2215 is therefore inhibition of LOC169225 (Accession XM_108531). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169225. LOC169966 (Accession XM_093010) is another VGAM2215 host target gene. LOC169966 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC169966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169966 BINDING SITE, designated SEQ ID:40163, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76126] Another function of VGAM2215 is therefore inhibition of LOC169966 (Accession XM_093010). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169966. LOC51157 (Accession NM_016202) is an-

other VGAM2215 host target gene. LOC51157 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51157 BINDING SITE, designated SEQ ID:18297, to the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, also designated SEQ ID:4926.

[76127] Another function of VGAM2215 is therefore inhibition of LOC51157 (Accession NM_016202). Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51157. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2216 (VGAM2216) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76128] VGAM2216 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2216 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[76129] VGAM2216 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2216 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76130] VGAM2216 gene encodes a VGAM2216 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2216 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2216 precursor RNA is designated SEQ ID:2202, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2202 is located at position 192667 relative to the genome of Ectromelia Virus.

[76131] VGAM2216 precursor RNA folds onto itself, forming VGAM2216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76132] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2216 folded precursor RNA into VGAM2216 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2216 RNA is designated SEQ ID:4927, and is provided hereinbelow with reference to the sequence listing part.

[76133] VGAM2216 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2216 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2216 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76134] VGAM2216 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2216 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2216 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2216 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2216 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76135] The complementary binding of VGAM2216 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2216 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2216 host target RNA into VGAM2216 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76136] It is appreciated that VGAM2216 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2216 host target genes. The mRNA of each one of this plurality of VGAM2216 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2216 RNA, herein designated VGAM RNA, and which when bound by VGAM2216 RNA causes inhibition of translation of respective one or more VGAM2216 host target proteins.

[76137] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2216 gene, herein designated VGAM GENE, on one or more VGAM2216 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76138] It is yet further appreciated that a function of VGAM2216 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2216 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2216 correlate with, and may be deduced from, the identity of the host target genes which VGAM2216 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76139] Nucleotide sequences of the VGAM2216 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2216 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2216 are further described hereinbelow with reference to Table 1.

[76140] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2216 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2216 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76141] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2216 gene, herein designated VGAM is inhibition of expression of VGAM2216 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2216 correlate with, and may be deduced from, the identity of the target genes which VGAM2216 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76142] Cytochrome P450, Subfamily IIIA (niphedipine oxidase), Polypeptide 4 (CYP3A4, Accession NM_017460) is a VGAM2216 host target gene. CYP3A4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP3A4, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP3A4 BINDING SITE, designated SEQ ID:18931, to the nucleotide sequence of VGAM2216 RNA, herein designated VGAM RNA, also designated SEQ ID:4927.

[76143] A function of VGAM2216 is therefore inhibition of Cytochrome P450, Subfamily IIIA (niphedipine oxidase), Polypeptide 4 (CYP3A4, Accession NM_017460), a gene which may be involved in an nadph-dependent electron transport pathway. Accordingly, utilities of VGAM2216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP3A4. The function of CYP3A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM955.Inducible T-cell Co-stimulator (ICOS, Accession NM_012092) is another VGAM2216 host target gene. ICOS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICOS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

ICOS BINDING SITE, designated SEQ ID:14382, to the nucleotide sequence of VGAM2216 RNA, herein designated VGAM RNA, also designated SEQ ID:4927.

[76144] Another function of VGAM2216 is therefore inhibition of Inducible T-cell Co-stimulator (ICOS, Accession NM_012092), a gene which forms homodimers and functions as an inducible T-cell co-stimulator. Accordingly, utilities of VGAM2216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICOS. The function of ICOS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18.LOC256790 (Accession XM_170679) is another VGAM2216 host target gene. LOC256790 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256790 BINDING SITE, designated SEQ ID:45459, to the nucleotide sequence of VGAM2216 RNA, herein designated VGAM RNA, also designated SEQ ID:4927.

[76145] Another function of VGAM2216 is therefore inhibition of LOC256790 (Accession XM_170679). Accordingly, utilities of VGAM2216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256790. LOC91421 (Accession XM_038364) is another VGAM2216 host target gene. LOC91421 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91421 BINDING SITE, designated SEQ ID:32827, to the nucleotide sequence of VGAM2216 RNA, herein designated VGAM RNA, also designated SEQ ID:4927.

[76146] Another function of VGAM2216 is therefore inhibition of LOC91421 (Accession XM_038364). Accordingly, utilities of VGAM2216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91421. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2217 (VGAM2217) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[76147] VGAM2217 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2217 was detected is described hereinabove with reference to Figs. 1-8.

[76148] VGAM2217 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2217 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76149] VGAM2217 gene encodes a VGAM2217 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2217 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2217 precursor RNA is designated SEQ ID:2203, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2203 is located at position 198184 relative to the genome of Ectromelia Virus.

[76150] VGAM2217 precursor RNA folds onto itself, forming VGAM2217 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76151] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2217 folded precursor RNA into VGAM2217 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2217 RNA is designated SEQ ID:4928, and is provided hereinbelow with reference to the sequence listing part.

[76152] VGAM2217 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2217 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2217 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76153] VGAM2217 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2217 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2217 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2217 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2217 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76154] The complementary binding of VGAM2217 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2217 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2217 host target RNA into VGAM2217 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76155] It is appreciated that VGAM2217 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2217 host target genes. The mRNA of each one of this plurality of VGAM2217 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2217 RNA, herein designated VGAM RNA, and which when bound by VGAM2217 RNA causes inhibition of translation of respective one or more VGAM2217 host target proteins.

[76156] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2217 gene, herein designated VGAM GENE, on one or more VGAM2217 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76157] It is yet further appreciated that a function of VGAM2217 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2217 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2217 correlate with, and may be deduced from, the identity of the host target genes which VGAM2217 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[76158] Nucleotide sequences of the VGAM2217 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2217 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2217 are further described hereinbelow with reference to Table 1.

[76159] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2217 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2217 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76160] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2217 gene, herein designated VGAM is inhibition of expression of VGAM2217 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2217 correlate with, and may be deduced from, the identity of the target genes which VGAM2217 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76161] Solute Carrier Family 22 (extraneuronal monoamine transporter), Member 3 (SLC22A3, Accession NM_021977) is a VGAM2217 host target gene. SLC22A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC22A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A3 BINDING SITE, designated SEQ ID:22503, to the nucleotide sequence of VGAM2217 RNA, herein designated VGAM RNA, also designated SEQ ID:4928.

[76162] A function of VGAM2217 is therefore inhibition of Solute Carrier Family 22 (extraneuronal monoamine transporter), Member 3 (SLC22A3, Accession NM_021977), a gene which is a sodium-ion dependent, high affinity carnitine transporter. also transports organic cations without the involvement of sodium. involved in the active cellular uptake of carnitine. Accordingly, utilities of VGAM2217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A3. The function of SLC22A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM2147.Solute Carrier Family 6 (neurotransmitter transporter, betaine/GABA), Member 12 (SLC6A12, Accession NM_003044) is another VGAM2217 host target gene. SLC6A12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC6A12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A12 BINDING SITE, designated SEQ ID:9010, to the nucleotide sequence of VGAM2217 RNA, herein designated VGAM RNA, also designated SEQ ID:4928.

[76163] Another function of VGAM2217 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, betaine/GABA), Member 12 (SLC6A12, Accession NM_003044), a gene which transports betaine and gaba. Accordingly, utilities of VGAM2217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A12. The function of SLC6A12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM293.Chromosome 22 Open Reading Frame 23

(C22orf23, Accession NM_032561) is another VGAM2217 host target gene. C22orf23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C22orf23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf23 BINDING SITE, designated SEQ ID:26287, to the nucleotide sequence of VGAM2217 RNA, herein designated VGAM RNA, also designated SEQ ID:4928.

[76164] Another function of VGAM2217 is therefore inhibition of Chromosome 22 Open Reading Frame 23 (C22orf23, Accession NM_032561). Accordingly, utilities of VGAM2217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf23.

FLJ10159 (Accession NM_018013) is another VGAM2217 host target gene. FLJ10159 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10159 BINDING SITE, designated SEQ ID:19748, to the nucleotide sequence of

VGAM2217 RNA, herein designated VGAM RNA, also designated SEQ ID:4928.

[76165] Another function of VGAM2217 is therefore inhibition of FLJ10159 (Accession NM_018013). Accordingly, utilities of VGAM2217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10159. KIAA1323 (Accession XM_032146) is another VGAM2217 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31566, to the nucleotide sequence of VGAM2217 RNA, herein designated VGAM RNA, also designated SEQ ID:4928.

[76166] Another function of VGAM2217 is therefore inhibition of KIAA1323 (Accession XM_032146). Accordingly, utilities of VGAM2217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2218 (VGAM2218) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76167] VGAM2218 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2218 was detected is described hereinabove with reference to Figs. 1-8.

[76168] VGAM2218 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2218 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76169] VGAM2218 gene encodes a VGAM2218 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2218 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2218 precursor RNA is designated SEQ ID:2204, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2204 is located at position 188178 relative to the genome of Ectromelia Virus.

[76170] VGAM2218 precursor RNA folds onto itself, forming VGAM2218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76171] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2218 folded precursor RNA into VGAM2218 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2218 RNA is designated SEQ ID:4929, and is provided hereinbelow with reference to the sequence listing part.

[76172] VGAM2218 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2218 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2218 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76173] VGAM2218 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2218 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2218 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2218 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2218 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76174] The complementary binding of VGAM2218 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2218 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2218 host target RNA into VGAM2218 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76175] It is appreciated that VGAM2218 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2218 host target genes. The mRNA of each one of this plurality of VGAM2218 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2218 RNA, herein designated VGAM RNA, and which when bound by VGAM2218 RNA causes inhibition of translation of respective one or more VGAM2218 host target proteins.

[76176] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2218 gene, herein designated VGAM GENE, on one or more VGAM2218 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76177] It is yet further appreciated that a function of VGAM2218 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2218 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2218 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2218 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76178] Nucleotide sequences of the VGAM2218 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2218 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2218 are further described hereinbelow with reference to Table 1.

[76179] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2218 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2218 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76180] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2218 gene, herein designated VGAM is inhibition of expression of VGAM2218 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2218 correlate with, and may be deduced from, the identity of the target genes which VGAM2218

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76181] FLJ13072 (Accession XM_117117) is a VGAM2218 host target gene. FLJ13072 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13072 BINDING SITE, designated SEQ ID:43233, to the nucleotide sequence of VGAM2218 RNA, herein designated VGAM RNA, also designated SEQ ID:4929.

[76182] A function of VGAM2218 is therefore inhibition of FLJ13072 (Accession XM_117117). Accordingly, utilities of VGAM2218 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13072. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2219 (VGAM2219) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76183] VGAM2219 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2219 was detected is described hereinabove with reference to Figs. 1-8.

[76184] VGAM2219 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2219 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76185] VGAM2219 gene encodes a VGAM2219 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2219 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2219 precursor RNA is designated SEQ ID:2205, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2205 is located at position 190763 relative to the genome of Ectromelia Virus.

[76186] VGAM2219 precursor RNA folds onto itself, forming VGAM2219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76187] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2219 folded precursor RNA into VGAM2219 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2219 RNA is designated SEQ ID:4930, and is provided hereinbelow with reference to the sequence listing part.

[76188] VGAM2219 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2219 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2219 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[76189] VGAM2219 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2219 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2219 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2219 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2219 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76190] The complementary binding of VGAM2219 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2219 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2219 host target RNA into VGAM2219 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76191] It is appreciated that VGAM2219 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2219 host target genes. The mRNA of each one of this plurality of VGAM2219 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2219 RNA, herein designated VGAM RNA, and which when bound by VGAM2219 RNA causes inhibition of translation of respective one or more VGAM2219 host target proteins.

[76192] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2219 gene, herein designated VGAM GENE, on one or more VGAM2219 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76193] It is yet further appreciated that a function of VGAM2219 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2219 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2219 correlate with, and may be deduced from, the identity of the host target genes which VGAM2219 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76194] Nucleotide sequences of the VGAM2219 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2219 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2219 are further described hereinbelow with reference to Table 1.

[76195] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2219 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2219 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76196] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2219 gene, herein designated VGAM is inhibition of expression of VGAM2219 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2219 correlate with, and may be deduced from, the identity of the target genes which VGAM2219 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76197] Protocadherin Beta 16 (PCDHB16, Accession NM_020957) is a VGAM2219 host target gene. PCDHB16 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHB16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB16 BINDING SITE, designated SEQ ID:21945, to the nucleotide sequence of VGAM2219 RNA, herein designated VGAM RNA, also designated SEQ ID:4930.

[76198] A function of VGAM2219 is therefore inhibition of Protocadherin Beta 16 (PCDHB16, Accession NM_020957), a gene which is a potential calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM2219 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB16. The function of PCDHB16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM931.LOC221474 (Accession XM_166464) is another VGAM2219 host target gene. LOC221474 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC221474 BINDING SITE, designated SEQ ID:44382, to the nucleotide sequence of VGAM2219 RNA, herein designated VGAM RNA, also designated SEQ ID:4930.

[76199] Another function of VGAM2219 is therefore inhibition of LOC221474 (Accession XM_166464). Accordingly, utilities of VGAM2219 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221474. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2220 (VGAM2220) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76200] VGAM2220 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2220 was detected is described hereinabove with reference to Figs. 1-8.

[76201] VGAM2220 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2220 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[76202] VGAM2220 gene encodes a VGAM2220 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2220 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2220 precursor RNA is designated SEQ ID:2206, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2206 is located at position 196292 relative to the genome of Ectromelia Virus.

[76203] VGAM2220 precursor RNA folds onto itself, forming VGAM2220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76204] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2220 folded precursor RNA into VGAM2220 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2220 RNA is designated SEQ ID:4931, and is provided hereinbelow with reference to the sequence listing part.

[76205] VGAM2220 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2220 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2220 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76206] VGAM2220 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2220 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2220 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2220 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2220 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76207] The complementary binding of VGAM2220 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2220 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2220 host target RNA into VGAM2220 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76208] It is appreciated that VGAM2220 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2220 host target genes. The mRNA of each one of this plurality of VGAM2220 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2220 RNA, herein designated VGAM RNA, and which when bound by VGAM2220 RNA causes inhibition of translation of respective one or more VGAM2220 host target proteins.

[76209] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2220 gene, herein designated VGAM GENE, on one or more VGAM2220 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76210] It is yet further appreciated that a function of VGAM2220 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2220 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2220 correlate with, and may be deduced from, the identity of the host target genes which VGAM2220 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76211] Nucleotide sequences of the VGAM2220 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2220 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2220 are further described hereinbelow with reference to Table 1.

[76212] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2220 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2220 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76213] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2220 gene, herein designated VGAM is inhibition of expression of VGAM2220 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2220 correlate with, and may be deduced from, the identity of the target genes which VGAM2220 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76214] PRO2435 (Accession NM_018527) is a VGAM2220 host target gene. PRO2435 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2435 BINDING SITE, designated SEQ ID:20598, to the nucleotide sequence of VGAM2220 RNA, herein designated VGAM RNA, also designated SEQ ID:4931.

[76215] A function of VGAM2220 is therefore inhibition of PRO2435 (Accession NM_018527). Accordingly, utilities of VGAM2220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2435. LOC143425 (Accession XM_113695) is another VGAM2220 host target gene. LOC143425 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143425 BINDING SITE, designated SEQ ID:42354, to the nucleotide sequence of VGAM2220 RNA, herein designated VGAM RNA, also designated SEQ ID:4931.

[76216] Another function of VGAM2220 is therefore inhibition of LOC143425 (Accession XM_113695). Accordingly, utilities of VGAM2220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143425. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2221 (VGAM2221) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[76217] VGAM2221 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2221 was detected is described hereinabove with reference to Figs. 1-8.

[76218] VGAM2221 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2221 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76219] VGAM2221 gene encodes a VGAM2221 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2221 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2221 precursor RNA is designated SEQ ID:2207, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2207 is located at position 161928 relative to the genome of Equine Herpesvirus 2.

[76220] VGAM2221 precursor RNA folds onto itself, forming VGAM2221 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76221] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2221 folded precursor RNA into VGAM2221 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2221 RNA is designated SEQ ID:4932, and is provided hereinbelow with reference to the sequence listing part.

[76222] VGAM2221 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2221 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2221 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76223] VGAM2221 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2221 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2221 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2221 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2221 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76224] The complementary binding of VGAM2221 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2221 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2221 host target RNA into VGAM2221 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76225] It is appreciated that VGAM2221 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2221 host target genes. The mRNA of each one of this plurality of VGAM2221 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2221 RNA, herein designated VGAM RNA, and which when bound by VGAM2221 RNA causes inhibition of translation of respective one or more VGAM2221 host target proteins.

[76226] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2221 gene, herein designated VGAM GENE, on one or more VGAM2221 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76227] It is yet further appreciated that a function of VGAM2221 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2221 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2221 correlate with, and may be deduced from, the identity of the host target genes which VGAM2221 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[76228] Nucleotide sequences of the VGAM2221 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2221 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2221 are further described hereinbelow with reference to Table 1.

[76229] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2221 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2221 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76230] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2221 gene, herein designated VGAM is inhibition of expression of VGAM2221 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2221 correlate with, and may be deduced from, the identity of the target genes which VGAM2221 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76231] Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM_001271) is a VGAM2221 host target gene. CHD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHD2 BINDING SITE, designated SEQ ID:6936, to the nucleotide sequence of VGAM2221 RNA, herein designated VGAM RNA, also designated SEQ ID:4932.

[76232] A function of VGAM2221 is therefore inhibition of Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM_001271). Accordingly, utilities of VGAM2221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHD2. Coenzyme Q7 Homolog, Ubiquinone (yeast) (COQ7, Accession NM_016138) is another VGAM2221 host target gene. COQ7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COQ7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COQ7 BINDING SITE, designated SEQ ID:18222,

to the nucleotide sequence of VGAM2221 RNA, herein designated VGAM RNA, also designated SEQ ID:4932.

[76233] Another function of VGAM2221 is therefore inhibition of Coenzyme Q7 Homolog, Ubiquinone (yeast) (COQ7, Accession NM_016138). Accordingly, utilities of VGAM2221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COQ7. KIAA1969 (Accession XM_086098) is another VGAM2221 host target gene. KIAA1969 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1969 BINDING SITE, designated SEQ ID:38490, to the nucleotide sequence of VGAM2221 RNA, herein designated VGAM RNA, also designated SEQ ID:4932.

[76234] Another function of VGAM2221 is therefore inhibition of KIAA1969 (Accession XM_086098). Accordingly, utilities of VGAM2221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1969. LOC153196 (Accession XM_098323) is another VGAM2221 host target gene. LOC153196 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, designated SEQ ID:41586, to the nucleotide sequence of VGAM2221 RNA, herein designated VGAM RNA, also designated SEQ ID:4932.

[76235] Another function of VGAM2221 is therefore inhibition of LOC153196 (Accession XM_098323). Accordingly, utilities of VGAM2221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153196. LOC169026 (Accession XM_095471) is another VGAM2221 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC169026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40260, to the nucleotide sequence of VGAM2221 RNA, herein designated VGAM RNA, also designated SEQ ID:4932.

[76236] Another function of VGAM2221 is therefore inhibition of

LOC169026 (Accession XM_095471). Accordingly, utilities of VGAM2221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169026. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2222 (VGAM2222) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76237] VGAM2222 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2222 was detected is described hereinabove with reference to Figs. 1-8.

[76238] VGAM2222 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2222 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76239] VGAM2222 gene encodes a VGAM2222 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2222 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2222 precursor RNA is designated SEQ ID:2208, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2208 is located at position 11521 relative to the genome of Equine Herpesvirus 2.

[76240] VGAM2222 precursor RNA folds onto itself, forming VGAM2222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76241] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2222 folded precursor RNA into VGAM2222 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide se-

quence of VGAM2222 RNA is designated SEQ ID:4933, and is provided hereinbelow with reference to the sequence listing part.

[76242] VGAM2222 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2222 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2222 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76243] VGAM2222 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2222 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2222 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2222 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2222 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76244] The complementary binding of VGAM2222 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2222 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2222 host target RNA into VGAM2222 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76245] It is appreciated that VGAM2222 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2222 host target genes. The mRNA of each one of this plurality of VGAM2222 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2222 RNA, herein designated VGAM RNA, and which when bound by VGAM2222 RNA causes inhibition of translation of respective one or more VGAM2222 host target proteins.

[76246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2222 gene, herein designated VGAM GENE, on one or more VGAM2222 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76247] It is yet further appreciated that a function of VGAM2222

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2222 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2222 correlate with, and may be deduced from, the identity of the host target genes which VGAM2222 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76248] Nucleotide sequences of the VGAM2222 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2222 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2222 are further described hereinbelow with reference to Table 1.

[76249] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2222 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2222 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76250] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2222 gene, herein designated VGAM is inhibition of expression of VGAM2222 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2222 correlate with, and may be deduced from, the identity of the target genes which VGAM2222 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76251] CSE-C (Accession XM_166163) is a VGAM2222 host target gene. CSE-C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSE-C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSE-C BINDING SITE, designated SEQ ID:43982, to the nucleotide sequence of VGAM2222 RNA, herein designated VGAM RNA, also designated SEQ ID:4933.

[76252] A function of VGAM2222 is therefore inhibition of CSE-C (Accession XM_166163). Accordingly, utilities of VGAM2222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSE-C. DKFZP434N178 (Accession XM_050278) is another

VGAM2222 host target gene. DKFZP434N178 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434N178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N178 BINDING SITE, designated SEQ ID:35599, to the nucleotide sequence of VGAM2222 RNA, herein designated VGAM RNA, also designated SEQ ID:4933.

[76253] Another function of VGAM2222 is therefore inhibition of DKFZP434N178 (Accession XM_050278). Accordingly, utilities of VGAM2222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N178. LOC203411 (Accession XM_117547) is another VGAM2222 host target gene. LOC203411 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203411 BINDING SITE, designated SEQ ID:43566, to the nucleotide sequence of VGAM2222 RNA,

herein designated VGAM RNA, also designated SEQ ID:4933.

[76254] Another function of VGAM2222 is therefore inhibition of LOC203411 (Accession XM_117547). Accordingly, utilities of VGAM2222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203411. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2223 (VGAM2223) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76255] VGAM2223 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2223 was detected is described hereinabove with reference to Figs. 1-8.

[76256] VGAM2223 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2223 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76257] VGAM2223 gene encodes a VGAM2223 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2223 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2223 precursor RNA is designated SEQ ID:2209, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2209 is located at position 2065 relative to the genome of Equine Herpesvirus 2.

[76258] VGAM2223 precursor RNA folds onto itself, forming VGAM2223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76259] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2223 folded precursor RNA into VGAM2223 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2223 RNA is designated SEQ ID:4934, and is provided hereinbelow with reference to the sequence listing part.

[76260] VGAM2223 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2223 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2223 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76261] VGAM2223 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2223 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2223 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2223 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2223 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76262] The complementary binding of VGAM2223 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2223 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2223 host target RNA into VGAM2223 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76263] It is appreciated that VGAM2223 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2223 host target genes. The mRNA of each one of this plurality of VGAM2223 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2223 RNA, herein designated VGAM RNA, and which when bound by VGAM2223 RNA causes inhibition of translation of respective one or more VGAM2223 host target proteins.

[76264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2223 gene, herein designated VGAM GENE, on one or more VGAM2223 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76265] It is yet further appreciated that a function of VGAM2223 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2223 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2223 correlate with, and may be deduced from, the identity of the host target genes which VGAM2223 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76266] Nucleotide sequences of the VGAM2223 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2223 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2223 are further described hereinbelow with reference to Table 1.

[76267] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2223 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2223 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76268] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2223 gene, herein designated VGAM is inhibition of expression of VGAM2223 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2223 correlate with, and may be deduced from, the identity of the target genes which VGAM2223 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76269] EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838) is a VGAM2223 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41871, to the nucleotide sequence of VGAM2223 RNA, herein designated VGAM RNA, also designated SEQ ID:4934.

[76270] A function of VGAM2223 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838).

Accordingly, utilities of VGAM2223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Egl Nine Homolog 1 (C. elegans) (EGLN1, Accession NM_022051) is another VGAM2223 host target gene. EGLN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EGLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN1 BINDING SITE, designated SEQ ID:22586, to the nucleotide sequence of VGAM2223 RNA, herein designated VGAM RNA, also designated SEQ ID:4934.

[76271] Another function of VGAM2223 is therefore inhibition of Egl Nine Homolog 1 (C. elegans) (EGLN1, Accession NM_022051), a gene which is expressed in the cytoplasm of arterial smooth muscle cells. Accordingly, utilities of VGAM2223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN1. The function of EGLN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM216.Erbb2 Interacting Protein (ERBB2IP, Accession

NM_018695) is another VGAM2223 host target gene. ERBB2IP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ERBB2IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERBB2IP BINDING SITE, designated SEQ ID:20769, to the nucleotide sequence of VGAM2223 RNA, herein designated VGAM RNA, also designated SEQ ID:4934.

[76272] Another function of VGAM2223 is therefore inhibition of Erbb2 Interacting Protein (ERBB2IP, Accession NM_018695), a gene which ERBB2 interacting protein; acts as an adaptor for the receptor ERBB2/HER2. Accordingly, utilities of VGAM2223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERBB2IP. The function of ERBB2IP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1019.FOG2 (Accession NM_012082) is another VGAM2223 host target gene. FOG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FOG2,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOG2 BINDING SITE, designated SEQ ID:14371, to the nucleotide sequence of VGAM2223 RNA, herein designated VGAM RNA, also designated SEQ ID:4934.

[76273] Another function of VGAM2223 is therefore inhibition of FOG2 (Accession NM_012082), a gene which Interacts with and modulates activities of GATA-1 and mCtBP2. Accordingly, utilities of VGAM2223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOG2. The function of FOG2 has been established by previous studies. Svensson et al. (1999) showed that mouse Fog2 associates physically with the N-terminal zinc finger of Gata4 both in vitro and in vivo. This interaction appears to modulate specifically the transcriptional activity of Gata4 because overexpression of Fog2 in both NIH 3T3 cells and primary rat cardiomyocytes repressed Gata4-dependent transcription from multiple cardiac-restricted promoters. Taken together, these results implicated FOG2 as a novel modulator of GATA4 function during cardiac development and suggested a paradigm in which tissue-specific interactions between different FOG

and GATA proteins regulate the differentiation of distinct mesodermal cell lineages. Animal model experiments lend further support to the function of FOG2. GATA4 is a zinc finger transcription factor with a role in early cardiac development. GATA4-deficient mice fail to form a ventral heart tube and die of circulatory failure at embryonic day (E)8.5. Zfpm2, also know as Fog2, is a multi-zinc-finger protein that is coexpressed with Gata4 in the developing heart beginning at E8.5. Zfpm2 interacts specifically with the N-terminal zinc finger of Gata4 and represses Gata4-dependent transcription. Svensson et al. (2000) used targeted mutagenesis to explore the role of Zfpm2 in normal cardiac development. Zfpm2-deficient mice died of congestive heart failure at E13 with a syndrome of tricuspid atresia (OMIM Ref. No. 605067) that included an absent tricuspid valve, a large atrial septal defect, a ventral septal defect, an elongated left ventricular outflow tract, rightward displacement of the aortic valve, and pulmonic stenosis. These mice also displayed hypoplasia of the compact zone of the left ventricle. Findings indicated the importance of Zfpm2 in the normal looping and septation of the heart and suggested a genetic basis for the syndrome of tricuspid atresia.

[76274] It is appreciated that the abovementioned animal model for FOG2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[76275] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[76276] Svensson, E. C.; Huggins, G. S.; Lin, H.; Clendenin, C.; Jiang, F.; Tufts, R.; Dardik, F. B.; Leiden, J. M. : A syndrome of tricuspid atresia in mice with a targeted mutation of the gene encoding Fog-2. Nature Genet. 25: 353-356, 2000. ; and

[76277] Svensson, E. C.; Tufts, R. L.; Polk, C. E.; Leiden, J. M. : Molecular cloning of FOG-2: a modulator of transcription factor GATA-4 in cardiomyocytes. Proc. Nat. Acad. Sci. 96: 956-961.

[76278] Further studies establishing the function and utilities of FOG2 are found in John Hopkins OMIM database record ID 603693, and in sited publications numbered 991 and 9919-4953 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.TNF Receptor-associated Factor 5 (TRAF5, Accession NM_004619) is another VGAM2223 host target gene.

TRAF5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRAF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF5 BINDING SITE, designated SEQ ID:10963, to the nucleotide sequence of VGAM2223 RNA, herein designated VGAM RNA, also designated SEQ ID:4934.

[76279] Another function of VGAM2223 is therefore inhibition of TNF Receptor-associated Factor 5 (TRAF5, Accession NM_004619), a gene which Member of a family of proteins that interact with TNF receptors; binds the lymphotoxin beta receptor (LTBR). Accordingly, utilities of VGAM2223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF5. The function of TRAF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM76.KIAA0643 (Accession NM_024793) is another VGAM2223 host target gene. KIAA0643 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0643, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0643 BINDING SITE, designated SEQ ID:24172, to the nucleotide sequence of VGAM2223 RNA, herein designated VGAM RNA, also designated SEQ ID:4934.

[76280] Another function of VGAM2223 is therefore inhibition of KIAA0643 (Accession NM_024793). Accordingly, utilities of VGAM2223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0643. KIAA1676 (Accession XM_167612) is another VGAM2223 host target gene. KIAA1676 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1676 BINDING SITE, designated SEQ ID:44725, to the nucleotide sequence of VGAM2223 RNA, herein designated VGAM RNA, also designated SEQ ID:4934.

[76281] Another function of VGAM2223 is therefore inhibition of KIAA1676 (Accession XM_167612). Accordingly, utilities of VGAM2223 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1676. LOC199725 (Accession XM_117119) is another VGAM2223 host target gene. LOC199725 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199725 BINDING SITE, designated SEQ ID:43240, to the nucleotide sequence of VGAM2223 RNA, herein designated VGAM RNA, also designated SEQ ID:4934.

[76282] Another function of VGAM2223 is therefore inhibition of LOC199725 (Accession XM_117119). Accordingly, utilities of VGAM2223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199725. LOC200347 (Accession XM_114219) is another VGAM2223 host target gene. LOC200347 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200347 BINDING SITE, designated SEQ ID:42805, to

the nucleotide sequence of VGAM2223 RNA, herein designated VGAM RNA, also designated SEQ ID:4934.

[76283] Another function of VGAM2223 is therefore inhibition of LOC200347 (Accession XM_114219). Accordingly, utilities of VGAM2223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200347. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2224 (VGAM2224) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76284] VGAM2224 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2224 was detected is described hereinabove with reference to Figs. 1-8.

[76285] VGAM2224 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2224 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76286] VGAM2224 gene encodes a VGAM2224 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2224 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2224 precursor RNA is designated SEQ ID:2210, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2210 is located at position 2628 relative to the genome of Equine Herpesvirus 2.

[76287] VGAM2224 precursor RNA folds onto itself, forming VGAM2224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76288] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2224 folded precursor RNA into VGAM2224 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2224 RNA is designated SEQ ID:4935, and is provided hereinbelow with reference to the sequence listing part.

[76289] VGAM2224 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2224 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2224 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76290] VGAM2224 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2224 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2224 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2224 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2224 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76291] The complementary binding of VGAM2224 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2224 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2224 host target RNA into VGAM2224 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76292] It is appreciated that VGAM2224 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2224 host target genes. The mRNA of each one of this plurality of VGAM2224 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2224 RNA, herein designated VGAM RNA, and which when bound by VGAM2224 RNA causes inhibition of translation of respective one or more VGAM2224 host target proteins.

[76293] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2224 gene, herein designated VGAM GENE, on one or more VGAM2224 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76294] It is yet further appreciated that a function of VGAM2224 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2224 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2224 correlate with, and may be deduced from, the identity of the host target genes which VGAM2224 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76295] Nucleotide sequences of the VGAM2224 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2224 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2224 are further described hereinbelow with reference to Table 1.

[76296] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2224 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2224 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76297] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2224 gene, herein designated VGAM is inhibition of expression of VGAM2224 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2224 correlate with, and may be deduced from, the identity of the target genes which VGAM2224 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76298] Adenylate Cyclase 6 (ADCY6, Accession NM_015270) is a VGAM2224 host target gene. ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADCY6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2, designated SEQ ID:17586 and SEQ ID:21974 respectively, to the nucleotide sequence of VGAM2224 RNA, herein designated VGAM RNA, also designated SEQ ID:4935.

[76299] A function of VGAM2224 is therefore inhibition of Adenylate Cyclase 6 (ADCY6, Accession NM_015270), a gene which this a membrane-bound, ca(2+)-inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of VGAM2224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6. The function of ADCY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM22.Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession XM_168302) is another VGAM2224 host target gene. ZNF36 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF36 BINDING SITE, designated SEQ ID:45102, to the nucleotide sequence of VGAM2224 RNA, herein designated VGAM RNA, also designated SEQ ID:4935.

[76300] Another function of VGAM2224 is therefore inhibition of Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession XM_168302), a gene which may be involved in transcrip-

tional regulation. Accordingly, utilities of VGAM2224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF36. The function of ZNF36 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM804.A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM_016248) is another VGAM2224 host target gene. AKAP11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKAP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP11 BINDING SITE, designated SEQ ID:18371, to the nucleotide sequence of VGAM2224 RNA, herein designated VGAM RNA, also designated SEQ ID:4935.

[76301] Another function of VGAM2224 is therefore inhibition of A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM_016248). Accordingly, utilities of VGAM2224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP11. Fig. 1 further provides a conceptual description of a novel bioinformatically

detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2225 (VGAM2225) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76302] VGAM2225 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2225 was detected is described hereinabove with reference to Figs. 1-8.

[76303] VGAM2225 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2225 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76304] VGAM2225 gene encodes a VGAM2225 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2225 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2225 precursor RNA is designated SEQ ID:2211, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2211 is located at position 9536 relative to the

genome of Equine Herpesvirus 2.

[76305] VGAM2225 precursor RNA folds onto itself, forming VGAM2225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76306] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2225 folded precursor RNA into VGAM2225 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2225 RNA is designated SEQ ID:4936, and is provided hereinbelow with reference to the sequence listing part.

[76307] VGAM2225 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2225 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2225 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76308] VGAM2225 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2225 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2225 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2225 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2225 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76309] The complementary binding of VGAM2225 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2225 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2225 host target RNA into VGAM2225 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76310] It is appreciated that VGAM2225 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2225 host target genes. The mRNA of each one of this plurality of VGAM2225 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2225 RNA, herein designated VGAM RNA, and which when bound by VGAM2225 RNA causes inhibition of translation of respective one or more VGAM2225 host target proteins.

[76311] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2225 gene, herein designated VGAM GENE, on one or more VGAM2225 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76312] It is yet further appreciated that a function of VGAM2225 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2225 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2225

correlate with, and may be deduced from, the identity of the host target genes which VGAM2225 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76313] Nucleotide sequences of the VGAM2225 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2225 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2225 are further described hereinbelow with reference to Table 1.

[76314] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2225 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2225 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76315] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2225 gene, herein designated VGAM is inhibition of expression of VGAM2225 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2225 correlate with, and may be deduced

from, the identity of the target genes which VGAM2225 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76316] Exostoses (multiple)-like 3 (EXTL3, Accession NM_001440) is a VGAM2225 host target gene. EXTL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EXTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL3 BINDING SITE, designated SEQ ID:7166, to the nucleotide sequence of VGAM2225 RNA, herein designated VGAM RNA, also designated SEQ ID:4936.

[76317] A function of VGAM2225 is therefore inhibition of Exostoses (multiple)-like 3 (EXTL3, Accession NM_001440), a gene which a member of the multiple exostoses gene family. Accordingly, utilities of VGAM2225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL3. The function of EXTL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.LanC Lantibiotic Synthetase Component C-like 1 (bacterial)

(LANCL1, Accession NM_006055) is another VGAM2225 host target gene. LANCL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LANCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANCL1 BINDING SITE, designated SEQ ID:12693, to the nucleotide sequence of VGAM2225 RNA, herein designated VGAM RNA, also designated SEQ ID:4936.

[76318] Another function of VGAM2225 is therefore inhibition of LanC Lantibiotic Synthetase Component C-like 1 (bacterial) (LANCL1, Accession NM_006055), a gene which binds the C-terminus of stomatin. Accordingly, utilities of VGAM2225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL1. The function of LANCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM656.Lipoprotein Lipase (LPL, Accession NM_000237) is another VGAM2225 host target gene. LPL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LPL, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPL BINDING SITE, designated SEQ ID:5750, to the nucleotide sequence of VGAM2225 RNA, herein designated VGAM RNA, also designated SEQ ID:4936.

[76319] Another function of VGAM2225 is therefore inhibition of Lipoprotein Lipase (LPL, Accession NM_000237), a gene which is the hydrolysis of triglycerides of circulating chylomicrons and very low density lipoproteins (vldl). the enzyme functions in the presence of apolipoprotein c-2 on the luminal surface of vascular. Accordingly, utilities of VGAM2225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPL. The function of LPL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.FLJ22746 (Accession NM_024785) is another VGAM2225 host target gene. FLJ22746 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22746, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ22746 BINDING SITE, designated SEQ ID:24162, to the nucleotide sequence of VGAM2225 RNA, herein designated VGAM RNA, also designated SEQ ID:4936.

[76320] Another function of VGAM2225 is therefore inhibition of FLJ22746 (Accession NM_024785). Accordingly, utilities of VGAM2225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22746. LOC128077 (Accession XM_059208) is another VGAM2225 host target gene. LOC128077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC128077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128077 BINDING SITE, designated SEQ ID:36917, to the nucleotide sequence of VGAM2225 RNA, herein designated VGAM RNA, also designated SEQ ID:4936.

[76321] Another function of VGAM2225 is therefore inhibition of LOC128077 (Accession XM_059208). Accordingly, utilities of VGAM2225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128077. LOC151201 (Accession XM_098021) is an-

other VGAM2225 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:41320, to the nucleotide sequence of VGAM2225 RNA, herein designated VGAM RNA, also designated SEQ ID:4936.

[76322] Another function of VGAM2225 is therefore inhibition of LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM2225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. LOC152286 (Accession XM_098188) is another VGAM2225 host target gene. LOC152286 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152286 BINDING SITE, designated SEQ ID:41460, to the nucleotide sequence of VGAM2225 RNA, herein designated VGAM RNA, also designated SEQ ID:4936.

[76323] Another function of VGAM2225 is therefore inhibition of LOC152286 (Accession XM_098188). Accordingly, utilities of VGAM2225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152286. LOC221747 (Accession XM_166460) is another VGAM2225 host target gene. LOC221747 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221747 BINDING SITE, designated SEQ ID:44364, to the nucleotide sequence of VGAM2225 RNA, herein designated VGAM RNA, also designated SEQ ID:4936.

[76324] Another function of VGAM2225 is therefore inhibition of LOC221747 (Accession XM_166460). Accordingly, utilities of VGAM2225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221747. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2226 (VGAM2226) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[76325] VGAM2226 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2226 was detected is described hereinabove with reference to Figs. 1-8.

[76326] VGAM2226 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2226 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76327] VGAM2226 gene encodes a VGAM2226 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2226 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2226 precursor RNA is designated SEQ ID:2212, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2212 is located at position 161798 relative to the genome of Equine Herpesvirus 2.

[76328] VGAM2226 precursor RNA folds onto itself, forming VGAM2226 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76329] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2226 folded precursor RNA into VGAM2226 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2226 RNA is designated SEQ ID:4937, and is provided hereinbelow with reference to the sequence listing part.

[76330] VGAM2226 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2226 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2226 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76331] VGAM2226 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2226 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2226 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2226 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2226 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76332] The complementary binding of VGAM2226 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2226 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2226 host target RNA into VGAM2226 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76333] It is appreciated that VGAM2226 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2226 host target genes. The mRNA of each one of this plurality of VGAM2226 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2226 RNA, herein designated VGAM RNA, and which when bound by VGAM2226 RNA causes inhibition of translation of respective one or more VGAM2226 host target proteins.

[76334] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2226 gene, herein designated VGAM GENE, on one or more VGAM2226 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76335] It is yet further appreciated that a function of VGAM2226 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2226 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2226 correlate with, and may be deduced from, the identity of the host target genes which VGAM2226 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[76336] Nucleotide sequences of the VGAM2226 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2226 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2226 are further described hereinbelow with reference to Table 1.

[76337] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2226 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2226 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76338] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2226 gene, herein designated VGAM is inhibition of expression of VGAM2226 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2226 correlate with, and may be deduced from, the identity of the target genes which VGAM2226 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76339] B-cell CLL/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NM_001706) is a VGAM2226 host target gene. BCL6 BINDING SITE1 and BCL6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL6 BINDING SITE1 and BCL6 BINDING SITE2, designated SEQ ID:7428 and SEQ ID:29055 respectively, to the nucleotide sequence of VGAM2226 RNA, herein designated VGAM RNA, also designated SEQ ID:4937.

[76340] A function of VGAM2226 is therefore inhibition of B-cell CLL/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NM_001706), a gene which is involved in the generation and maintenance of both T and B cells during immune responses. Accordingly, utilities of VGAM2226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL6. The function of BCL6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481.Diacylglycerol Kinase, Gamma 90kDa (DGKG,

Accession NM_001346) is another VGAM2226 host target gene. DGKG BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DGKG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKG BINDING SITE, designated SEQ ID:7024, to the nucleotide sequence of VGAM2226 RNA, herein designated VGAM RNA, also designated SEQ ID:4937.

[76341] Another function of VGAM2226 is therefore inhibition of Diacylglycerol Kinase, Gamma 90kDa (DGKG, Accession NM_001346), a gene which may convert diacylglycerol to phosphatidic acid. Accordingly, utilities of VGAM2226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKG. The function of DGKG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM451.Heterogeneous Nuclear Ribonucleoprotein D (AU-rich element RNA binding protein 1, 37kDa) (HNRPD, Accession NM_002138) is another VGAM2226 host target gene. HNRPD BINDING SITE1 and HNRPD BINDING SITE2 are HOST TARGET binding sites found in untranslated re-

gions of mRNA encoded by HNRPD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPD BINDING SITE1 and HNRPD BINDING SITE2, designated SEQ ID:7913 and SEQ ID:25363 respectively, to the nucleotide sequence of VGAM2226 RNA, herein designated VGAM RNA, also designated SEQ ID:4937.

[76342] Another function of VGAM2226 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein D (AU-rich element RNA binding protein 1, 37kDa) (HNRPD, Accession NM_002138). Accordingly, utilities of VGAM2226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPD. Platelet Derived Growth Factor C (PDGFC, Accession NM_016205) is another VGAM2226 host target gene. PDGFC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDGFC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFC BINDING SITE, designated SEQ ID:18300, to the nucleotide sequence of VGAM2226 RNA, herein designated VGAM RNA,

also designated SEQ ID:4937.

[76343] Another function of VGAM2226 is therefore inhibition of Platelet Derived Growth Factor C (PDGFC, Accession NM_016205). Accordingly, utilities of VGAM2226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFC. SENP7 (Accession NM_020654) is another VGAM2226 host target gene. SENP7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SENP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SENP7 BINDING SITE, designated SEQ ID:21821, to the nucleotide sequence of VGAM2226 RNA, herein designated VGAM RNA, also designated SEQ ID:4937.

[76344] Another function of VGAM2226 is therefore inhibition of SENP7 (Accession NM_020654). Accordingly, utilities of VGAM2226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SENP7. SNRK (Accession NM_017719) is another VGAM2226 host target gene. SNRK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by SNRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNRK BINDING SITE, designated SEQ ID:19305, to the nucleotide sequence of VGAM2226 RNA, herein designated VGAM RNA, also designated SEQ ID:4937.

[76345] Another function of VGAM2226 is therefore inhibition of SNRK (Accession NM_017719). Accordingly, utilities of VGAM2226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNRK. T-box 19 (TBX19, Accession NM_005149) is another VGAM2226 host target gene. TBX19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBX19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBX19 BINDING SITE, designated SEQ ID:11622, to the nucleotide sequence of VGAM2226 RNA, herein designated VGAM RNA, also designated SEQ ID:4937.

[76346] Another function of VGAM2226 is therefore inhibition of T-box 19 (TBX19, Accession NM_005149). Accordingly,

utilities of VGAM2226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX19. LOC154282 (Accession XM_098505) is another VGAM2226 host target gene. LOC154282 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154282 BINDING SITE, designated SEQ ID:41695, to the nucleotide sequence of VGAM2226 RNA, herein designated VGAM RNA, also designated SEQ ID:4937.

[76347] Another function of VGAM2226 is therefore inhibition of LOC154282 (Accession XM_098505). Accordingly, utilities of VGAM2226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154282. LOC92539 (Accession XM_045632) is another VGAM2226 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC92539 BINDING SITE, designated SEQ ID:34495, to the nucleotide sequence of VGAM2226 RNA, herein designated VGAM RNA, also designated SEQ ID:4937.

[76348] Another function of VGAM2226 is therefore inhibition of LOC92539 (Accession XM_045632). Accordingly, utilities of VGAM2226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2227 (VGAM2227) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76349] VGAM2227 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2227 was detected is described hereinabove with reference to Figs. 1-8.

[76350] VGAM2227 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2227 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76351] VGAM2227 gene encodes a VGAM2227 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2227 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2227 precursor RNA is designated SEQ ID:2213, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2213 is located at position 161250 relative to the genome of Equine Herpesvirus 2.

[76352] VGAM2227 precursor RNA folds onto itself, forming VGAM2227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76353] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2227 folded precursor RNA into VGAM2227 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2227 RNA is designated SEQ ID:4938, and is provided hereinbelow with reference to the sequence listing part.

[76354] VGAM2227 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2227 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2227 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76355] VGAM2227 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2227 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2227 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2227 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2227 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76356] The complementary binding of VGAM2227 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2227 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2227 host target RNA into VGAM2227 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76357] It is appreciated that VGAM2227 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2227 host target genes. The mRNA of each one of this plurality of VGAM2227 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2227 RNA, herein designated VGAM RNA, and which when bound by VGAM2227 RNA causes inhibition of translation of respective one or more VGAM2227 host target proteins.

[76358] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2227 gene, herein designated VGAM GENE, on one or more VGAM2227 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76359] It is yet further appreciated that a function of VGAM2227 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2227 correlate with, and may be deduced from, the identity of the host target genes which VGAM2227 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76360] Nucleotide sequences of the VGAM2227 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2227 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2227 are further described hereinbelow with reference to Table 1.

[76361] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2227 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2227 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76362] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2227 gene, herein designated VGAM is inhibition of expression of VGAM2227 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2227 correlate with, and may be deduced from, the identity of the target genes which VGAM2227 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76363] A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM_116974) is a VGAM2227 host target gene. AKAP13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKAP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:43183, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76364] A function of VGAM2227 is therefore inhibition of A Ki-

nase (PRKA) Anchor Protein 13 (AKAP13, Accession XM_116974), a gene which regulates subcellular localization of type II cAMP-dependent PKA. Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13. The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM17.Aldehyde Dehydrogenase 8 Family, Member A1 (ALDH8A1, Accession NM_022568) is another VGAM2227 host target gene. ALDH8A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALDH8A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH8A1 BINDING SITE, designated SEQ ID:22890, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76365] Another function of VGAM2227 is therefore inhibition of Aldehyde Dehydrogenase 8 Family, Member A1 (ALDH8A1, Accession NM_022568). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with ALDH8A1. ATPase, Na+/K+ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678) is another VGAM2227 host target gene. ATP1B2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE, designated SEQ ID:7396, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76366] Another function of VGAM2227 is therefore inhibition of ATPase, Na+/K+ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na +/K+ ions across the plasma membrane. Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B2. The function of ATP1B2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.Cytoplasmic Linker Associated

Protein 1 (CLASP1, Accession XM_037105) is another VGAM2227 host target gene. CLASP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLASP1 BINDING SITE, designated SEQ ID:32543, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76367] Another function of VGAM2227 is therefore inhibition of Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105), a gene which plays a role in the local regulation of microtubule dynamics . Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLASP1. The function of CLASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM298.Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 3 (KCNA3, Accession NM_002232) is another VGAM2227 host target gene. KCNA3 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by KCNA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNA3 BINDING SITE, designated SEQ ID:8014, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76368] Another function of VGAM2227 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 3 (KCNA3, Accession NM_002232). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA3. Leptin (obesity homolog, mouse) (LEP, Accession NM_000230) is another VGAM2227 host target gene. LEP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LEP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEP BINDING SITE, designated SEQ ID:5737, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76369] Another function of VGAM2227 is therefore inhibition of Leptin (obesity homolog, mouse) (LEP, Accession NM_000230). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEP. Mastermind-like 1 (Drosophila) (MAML1, Accession NM_014757) is another VGAM2227 host target gene. MAML1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAML1 BINDING SITE, designated SEQ ID:16501, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76370] Another function of VGAM2227 is therefore inhibition of Mastermind-like 1 (Drosophila) (MAML1, Accession NM_014757), a gene which MAML1 functions as a transcriptional coactivator for Notch signaling. Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAML1. The function of MAML1 and its association with various diseases and clinical conditions, has been es-

tablished by previous studies, as described hereinabove with reference to VGAM556.Neuroepithelial Cell Transforming Gene 1 (NET1, Accession NM_005863) is another VGAM2227 host target gene. NET1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NET1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NET1 BINDING SITE, designated SEQ ID:12475, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76371] Another function of VGAM2227 is therefore inhibition of Neuroepithelial Cell Transforming Gene 1 (NET1, Accession NM_005863), a gene which is induced morphologic alterations and conferred a malignant phenotype in vitro and in nude mice. Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NET1. The function of NET1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1333.Polymerase (DNA directed), Theta (POLQ, Ac-

cession NM_006596) is another VGAM2227 host target gene. POLQ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POLQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLQ BINDING SITE, designated SEQ ID:13366, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76372] Another function of VGAM2227 is therefore inhibition of Polymerase (DNA directed), Theta (POLQ, Accession NM_006596), a gene which enhances untargeted mutagenesis. Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLQ. The function of POLQ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM922.RAD50 Homolog (S. cerevisiae) (RAD50, Accession NM_133482) is another VGAM2227 host target gene. RAD50 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAD50, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD50 BINDING SITE, designated SEQ ID:28553, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76373] Another function of VGAM2227 is therefore inhibition of RAD50 Homolog (S. cerevisiae) (RAD50, Accession NM_133482), a gene which is involved in dna double-strand break repair (dsbr). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD50. The function of RAD50 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132.AD022 (Accession XM_165725) is another VGAM2227 host target gene. AD022 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AD022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AD022 BINDING SITE, designated SEQ ID:43738, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA,

also designated SEQ ID:4938.

[76374] Another function of VGAM2227 is therefore inhibition of AD022 (Accession XM_165725). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD022. Butyrophilin, Subfamily 2, Member A2 (BTN2A2, Accession NM_006995) is another VGAM2227 host target gene. BTN2A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTN2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN2A2 BINDING SITE, designated SEQ ID:13862, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76375] Another function of VGAM2227 is therefore inhibition of Butyrophilin, Subfamily 2, Member A2 (BTN2A2, Accession NM_006995). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A2. Chromosome 21 Open Reading Frame 42 (C21orf42, Accession NM_058184) is another VGAM2227 host target gene.

C21orf42 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C21orf42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf42 BINDING SITE, designated SEQ ID:27750, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76376] Another function of VGAM2227 is therefore inhibition of Chromosome 21 Open Reading Frame 42 (C21orf42, Accession NM_058184). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf42. DKFZp547D155 (Accession XM_046977) is another VGAM2227 host target gene. DKFZp547D155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547D155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547D155 BINDING SITE, designated SEQ ID:34871, to the nucleotide sequence of VGAM2227 RNA,

herein designated VGAM RNA, also designated SEQ ID:4938.

[76377] Another function of VGAM2227 is therefore inhibition of DKFZp547D155 (Accession XM_046977). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547D155. F-box Protein 30 (FBXO30, Accession NM_032145) is another VGAM2227 host target gene. FBXO30 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXO30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO30 BINDING SITE, designated SEQ ID:25838, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76378] Another function of VGAM2227 is therefore inhibition of F-box Protein 30 (FBXO30, Accession NM_032145). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO30. FLJ31978 (Accession NM_144669) is another VGAM2227 host target gene.

FLJ31978 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ31978, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31978 BINDING SITE, designated SEQ ID:29491, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76379] Another function of VGAM2227 is therefore inhibition of FLJ31978 (Accession NM_144669). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31978. HSU24186 (Accession NM_013347) is another VGAM2227 host target gene. HSU24186 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSU24186, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSU24186 BINDING SITE, designated SEQ ID:14991, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76380] Another function of VGAM2227 is therefore inhibition of HSU24186 (Accession NM_013347). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSU24186. KIAA0939 (Accession XM_030524) is another VGAM2227 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31070, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76381] Another function of VGAM2227 is therefore inhibition of KIAA0939 (Accession XM_030524). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. KIAA1145 (Accession XM_037790) is another VGAM2227 host target gene. KIAA1145 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1145, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1145 BINDING SITE, designated SEQ ID:32681, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76382] Another function of VGAM2227 is therefore inhibition of KIAA1145 (Accession XM_037790). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1145. KIAA1432 (Accession XM_039698) is another VGAM2227 host target gene. KIAA1432 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1432 BINDING SITE, designated SEQ ID:33158, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76383] Another function of VGAM2227 is therefore inhibition of KIAA1432 (Accession XM_039698). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1432. KIAA1950 (Accession XM_166532) is another VGAM2227 host target gene. KIAA1950 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:44493, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76384] Another function of VGAM2227 is therefore inhibition of KIAA1950 (Accession XM_166532). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. MFN2 (Accession NM_014874) is another VGAM2227 host target gene. MFN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MFN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MFN2 BINDING SITE, designated SEQ ID:17013, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4938.

[76385] Another function of VGAM2227 is therefore inhibition of MFN2 (Accession NM_014874). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MFN2. MGC21738 (Accession NM_145044) is another VGAM2227 host target gene. MGC21738 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC21738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21738 BINDING SITE, designated SEQ ID:29678, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76386] Another function of VGAM2227 is therefore inhibition of MGC21738 (Accession NM_145044). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21738. Signal Transducer and Activator of Transcription 5A (STAT5A, Accession NM_003152) is another VGAM2227 host target gene. STAT5A BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by STAT5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAT5A BINDING SITE, designated SEQ ID:9130, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76387] Another function of VGAM2227 is therefore inhibition of Signal Transducer and Activator of Transcription 5A (STAT5A, Accession NM_003152). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT5A. LOC143872 (Accession XM_084665) is another VGAM2227 host target gene. LOC143872 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143872 BINDING SITE, designated SEQ ID:37655, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76388] Another function of VGAM2227 is therefore inhibition of

LOC143872 (Accession XM_084665). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143872. LOC144321 (Accession XM_096578) is another VGAM2227 host target gene. LOC144321 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144321 BINDING SITE, designated SEQ ID:40410, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76389] Another function of VGAM2227 is therefore inhibition of LOC144321 (Accession XM_096578). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144321. LOC145482 (Accession XM_085154) is another VGAM2227 host target gene. LOC145482 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC145482 BINDING SITE, designated SEQ ID:37878, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76390] Another function of VGAM2227 is therefore inhibition of LOC145482 (Accession XM_085154). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145482. LOC146782 (Accession XM_083963) is another VGAM2227 host target gene. LOC146782 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146782 BINDING SITE, designated SEQ ID:37525, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76391] Another function of VGAM2227 is therefore inhibition of LOC146782 (Accession XM_083963). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146782. LOC221474 (Accession XM_166464) is an-

other VGAM2227 host target gene. LOC221474 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221474 BINDING SITE, designated SEQ ID:44381, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76392] Another function of VGAM2227 is therefore inhibition of LOC221474 (Accession XM_166464). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221474. LOC90092 (Accession XM_028862) is another VGAM2227 host target gene. LOC90092 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90092 BINDING SITE, designated SEQ ID:30792, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76393] Another function of VGAM2227 is therefore inhibition of LOC90092 (Accession XM_028862). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90092. LOC92344 (Accession XM_044455) is another VGAM2227 host target gene. LOC92344 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92344 BINDING SITE, designated SEQ ID:34210, to the nucleotide sequence of VGAM2227 RNA, herein designated VGAM RNA, also designated SEQ ID:4938.

[76394] Another function of VGAM2227 is therefore inhibition of LOC92344 (Accession XM_044455). Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92344. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2228 (VGAM2228) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[76395] VGAM2228 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2228 was detected is described hereinabove with reference to Figs. 1-8.

[76396] VGAM2228 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2228 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76397] VGAM2228 gene encodes a VGAM2228 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2228 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2228 precursor RNA is designated SEQ ID:2214, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2214 is located at position 162465 relative to the genome of Equine Herpesvirus 2.

[76398] VGAM2228 precursor RNA folds onto itself, forming VGAM2228 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76399] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2228 folded precursor RNA into VGAM2228 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2228 RNA is designated SEQ ID:4939, and is provided hereinbelow with reference to the sequence listing part.

[76400] VGAM2228 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2228 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2228 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76401] VGAM2228 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2228 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2228 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2228 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2228 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76402] The complementary binding of VGAM2228 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2228 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2228 host target RNA into VGAM2228 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76403] It is appreciated that VGAM2228 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2228 host target genes. The mRNA of each one of this plurality of VGAM2228 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2228 RNA, herein designated VGAM RNA, and which when bound by VGAM2228 RNA causes inhibition of translation of respective one or more VGAM2228 host target proteins.

[76404] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2228 gene, herein designated VGAM GENE, on one or more VGAM2228 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76405] It is yet further appreciated that a function of VGAM2228 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2228 correlate with, and may be deduced from, the identity of the host target genes which VGAM2228 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[76406] Nucleotide sequences of the VGAM2228 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2228 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2228 are further described hereinbelow with reference to Table 1.

[76407] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2228 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2228 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76408] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2228 gene, herein designated VGAM is inhibition of expression of VGAM2228 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2228 correlate with, and may be deduced from, the identity of the target genes which VGAM2228 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76409] Calcium Channel, Voltage-dependent, Gamma Subunit 7 (CACNG7, Accession NM_031896) is a VGAM2228 host target gene. CACNG7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CACNG7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNG7 BINDING SITE, designated SEQ ID:25641, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76410] A function of VGAM2228 is therefore inhibition of Calcium Channel, Voltage-dependent, Gamma Subunit 7 (CACNG7, Accession NM_031896), a gene which may stabilize the calcium channel in an inactivated (closed) state. Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG7. The function of CACNG7 has been established by previous studies. Voltage-dependent calcium channels couple membrane depolarization in a number of cellular processes. These activities are regulated by distinct channels composed of the pore-forming alpha-1 subunit (e.g., CACNA1D; 114206) and the modulatory

beta (e.g., CACNB1; 114207), alpha-2/delta (e.g., CACNA2D1; 114204), and gamma (e.g., CACNG1; 114209) subunits. By RT-PCR and genomic sequence analysis, Burgess et al. (2001) determined that the CACNG7 gene, like CACNG6 and CACNG8, contains 4 exons.

[76411] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[76412] Burgess, D. L.; Gefrides, L. A.; Foreman, P. J.; Noebels, J. L. : A cluster of three novel Ca(2+) channel gamma subunit genes on chromosome 19q13.4: evolution and expression profile of the gamma subunit gene family. Genomics 71: 339-350, 2001. ; and

[76413] Chu, P.-J.; Robertson, H. M.; Best, P. M. : Calcium channel gamma subunits provide insights into the evolution of this gene family. Gene 280: 37-48, 2001.

[76414] Further studies establishing the function and utilities of CACNG7 are found in John Hopkins OMIM database record ID 606899, and in sited publications numbered 4526-4527 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Glutamate Receptor, Ionotropic, N-methyl D-

aspartate-like 1A (GRINL1A, Accession XM_045376) is another VGAM2228 host target gene. GRINL1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRINL1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRINL1A BINDING SITE, designated SEQ ID:34447, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76415] Another function of VGAM2228 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl D-aspartate-like 1A (GRINL1A, Accession XM_045376), a gene which plays a role in the development and function of the mammalian brain. Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRINL1A. The function of GRINL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53.Heparan Sulfate (glucosamine) 3-O-sulfotransferase 4 (HS3ST4, Accession XM_056254) is another VGAM2228 host target gene. HS3ST4 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HS3ST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS3ST4 BINDING SITE, designated SEQ ID:36372, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76416] Another function of VGAM2228 is therefore inhibition of Heparan Sulfate (glucosamine) 3-O-sulfotransferase 4 (HS3ST4, Accession XM_056254). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS3ST4. Integrin, Beta 3 (platelet glycoprotein IIIa, antigen CD61) (ITGB3, Accession NM_000212) is another VGAM2228 host target gene. ITGB3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB3 BINDING SITE, designated SEQ ID:5708, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4939.

[76417] Another function of VGAM2228 is therefore inhibition of Integrin, Beta 3 (platelet glycoprotein IIIa, antigen CD61) (ITGB3, Accession NM_000212). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB3. Pre-B-cell Leukemia Transcription Factor 2 (PBX2, Accession NM_002586) is another VGAM2228 host target gene. PBX2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PBX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PBX2 BINDING SITE, designated SEQ ID:8448, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76418] Another function of VGAM2228 is therefore inhibition of Pre-B-cell Leukemia Transcription Factor 2 (PBX2, Accession NM_002586), a gene which binds the sequence 5'-atcaatcaa-3'. Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PBX2. The function of PBX2 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM1063.Zinc Finger Protein 264 (ZNF264, Accession NM_003417) is another VGAM2228 host target gene. ZNF264 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF264 BINDING SITE, designated SEQ ID:9461, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76419] Another function of VGAM2228 is therefore inhibition of Zinc Finger Protein 264 (ZNF264, Accession NM_003417). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF264. CG012 (Accession XM_096710) is another VGAM2228 host target gene. CG012 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CG012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CG012 BINDING SITE, designated SEQ ID:40489, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76420] Another function of VGAM2228 is therefore inhibition of CG012 (Accession XM_096710). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG012. FLJ12604 (Accession XM_035022) is another VGAM2228 host target gene. FLJ12604 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12604, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12604 BINDING SITE, designated SEQ ID:32190, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76421] Another function of VGAM2228 is therefore inhibition of FLJ12604 (Accession XM_035022). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12604. Interleukin 1 Receptor Accessory Protein-like 1

(IL1RAPL1, Accession NM_014271) is another VGAM2228 host target gene. IL1RAPL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IL1RAPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RAPL1 BINDING SITE, designated SEQ ID:15553, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76422] Another function of VGAM2228 is therefore inhibition of Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM_014271). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RAPL1. KIAA1069 (Accession XM_042635) is another VGAM2228 host target gene. KIAA1069 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1069 BINDING SITE, designated SEQ ID:33724, to the

nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76423] Another function of VGAM2228 is therefore inhibition of KIAA1069 (Accession XM_042635). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1069. KIAA1318 (Accession XM_041080) is another VGAM2228 host target gene. KIAA1318 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1318 BINDING SITE, designated SEQ ID:33432, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76424] Another function of VGAM2228 is therefore inhibition of KIAA1318 (Accession XM_041080). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1318. KIAA1468 (Accession XM_166289) is another VGAM2228 host target gene. KIAA1468 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1468 BINDING SITE, designated SEQ ID:44100, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76425] Another function of VGAM2228 is therefore inhibition of KIAA1468 (Accession XM_166289). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1468. SAE1 (Accession NM_005500) is another VGAM2228 host target gene. SAE1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SAE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAE1 BINDING SITE, designated SEQ ID:12005, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76426] Another function of VGAM2228 is therefore inhibition of SAE1 (Accession NM_005500). Accordingly, utilities of

VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAE1. Zinc Finger Protein 36, C3H Type-like 2 (ZFP36L2, Accession NM_006887) is another VGAM2228 host target gene. ZFP36L2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFP36L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP36L2 BINDING SITE, designated SEQ ID:13754, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76427] Another function of VGAM2228 is therefore inhibition of Zinc Finger Protein 36, C3H Type-like 2 (ZFP36L2, Accession NM_006887). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP36L2. LOC151571 (Accession XM_098088) is another VGAM2228 host target gene. LOC151571 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151571 BINDING SITE, designated SEQ ID:41373, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76428] Another function of VGAM2228 is therefore inhibition of LOC151571 (Accession XM_098088). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151571. LOC158219 (Accession XM_088514) is another VGAM2228 host target gene. LOC158219 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158219 BINDING SITE, designated SEQ ID:39764, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76429] Another function of VGAM2228 is therefore inhibition of LOC158219 (Accession XM_088514). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158219. LOC257415 (Accession XM_171177) is another VGAM2228 host target gene. LOC257415 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257415 BINDING SITE, designated SEQ ID:45959, to the nucleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, also designated SEQ ID:4939.

[76430] Another function of VGAM2228 is therefore inhibition of LOC257415 (Accession XM_171177). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257415. LOC57019 (Accession NM_020313) is another VGAM2228 host target gene. LOC57019 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57019 BINDING SITE, designated SEQ ID:21570, to the nucleotide sequence of VGAM2228 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4939.

[76431] Another function of VGAM2228 is therefore inhibition of LOC57019 (Accession NM_020313). Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57019. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2229 (VGAM2229) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76432] VGAM2229 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2229 was detected is described hereinabove with reference to Figs. 1-8.

[76433] VGAM2229 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Aucuba Mosaic Virus. VGAM2229 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76434] VGAM2229 gene encodes a VGAM2229 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2229 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2229 precursor RNA is designated SEQ ID:2215, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2215 is located at position 827 relative to the genome of Potato Aucuba Mosaic Virus.

[76435] VGAM2229 precursor RNA folds onto itself, forming VGAM2229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76436] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2229 folded precursor RNA into VGAM2229 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2229 RNA is designated SEQ ID:4940, and is provided hereinbelow with reference to the sequence listing part.

[76437] VGAM2229 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2229 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2229 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76438] VGAM2229 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2229 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2229 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2229 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2229 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76439] The complementary binding of VGAM2229 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2229 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2229 host target RNA into VGAM2229 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76440] It is appreciated that VGAM2229 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2229 host target genes. The mRNA of

each one of this plurality of VGAM2229 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2229 RNA, herein designated VGAM RNA, and which when bound by VGAM2229 RNA causes inhibition of translation of respective one or more VGAM2229 host target proteins.

[76441] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2229 gene, herein designated VGAM GENE, on one or more VGAM2229 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76442] It is yet further appreciated that a function of VGAM2229 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2229 include diagnosis, prevention and treatment of viral infection by Potato Aucuba Mosaic Virus. Specific functions, and accordingly utilities, of

VGAM2229 correlate with, and may be deduced from, the identity of the host target genes which VGAM2229 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76443] Nucleotide sequences of the VGAM2229 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2229 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2229 are further described hereinbelow with reference to Table 1.

[76444] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2229 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2229 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76445] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2229 gene, herein designated VGAM is inhibition of expression of VGAM2229 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2229 correlate with, and may be deduced

from, the identity of the target genes which VGAM2229 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76446] Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655) is a VGAM2229 host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:8516, to the nucleotide sequence of VGAM2229 RNA, herein designated VGAM RNA, also designated SEQ ID:4940.

[76447] A function of VGAM2229 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655), a gene which contains a zinc finger domain. Accordingly, utilities of VGAM2229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM29.FLJ10140 (Accession NM_018006) is another VGAM2229 host target

gene. FLJ10140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10140 BINDING SITE, designated SEQ ID:19737, to the nucleotide sequence of VGAM2229 RNA, herein designated VGAM RNA, also designated SEQ ID:4940.

[76448] Another function of VGAM2229 is therefore inhibition of FLJ10140 (Accession NM_018006). Accordingly, utilities of VGAM2229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10140. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2230 (VGAM2230) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76449] VGAM2230 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2230 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[76450] VGAM2230 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Aucuba Mosaic Virus. VGAM2230 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76451] VGAM2230 gene encodes a VGAM2230 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2230 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2230 precursor RNA is designated SEQ ID:2216, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2216 is located at position 1300 relative to the genome of Potato Aucuba Mosaic Virus.

[76452] VGAM2230 precursor RNA folds onto itself, forming VGAM2230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76453] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2230 folded precursor RNA into VGAM2230 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2230 RNA is designated SEQ ID:4941, and is provided hereinbelow with reference to the sequence listing part.

[76454] VGAM2230 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2230 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2230 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76455] VGAM2230 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2230 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2230 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2230 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2230 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76456] The complementary binding of VGAM2230 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2230 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2230 host target RNA into VGAM2230 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76457] It is appreciated that VGAM2230 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2230 host target genes. The mRNA of each one of this plurality of VGAM2230 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2230 RNA, herein designated VGAM RNA, and which when bound by VGAM2230 RNA causes inhibition of translation of respective one or more VGAM2230 host target proteins.

[76458] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2230 gene, herein designated VGAM GENE, on one or more VGAM2230 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76459] It is yet further appreciated that a function of VGAM2230 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of viral infection by Potato Aucuba Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2230 correlate with, and may be deduced from, the identity of the host target genes which VGAM2230 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76460] Nucleotide sequences of the VGAM2230 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2230 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2230 are further described hereinbelow with reference to Table 1.

[76461] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2230 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2230 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76462] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2230 gene, herein designated VGAM is inhibition of expression of VGAM2230 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2230 correlate with, and may be deduced from, the identity of the target genes which VGAM2230 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76463] BIG1 (Accession NM_006421) is a VGAM2230 host target gene. BIG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of BIG1 BINDING SITE, designated SEQ ID:13139, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76464] A function of VGAM2230 is therefore inhibition of BIG1 (Accession NM_006421), a gene which is a guanine nucleotide-exchange protein, has a role in vesicular transport. Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIG1. The function of BIG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1190.Ca2+-dependent Activator Protein For Secretion (CADPS, Accession XM_036915) is another VGAM2230 host target gene. CADPS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CADPS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CADPS BINDING SITE, designated SEQ ID:32508, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4941.

[76465] Another function of VGAM2230 is therefore inhibition of Ca2+-dependent Activator Protein For Secretion (CADPS, Accession XM_036915), a gene which is required for the Ca2+-regulated exocytosis of secretory vesicles. Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CADPS. The function of CADPS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1315.Centaurin, Delta 1 (CENTD1, Accession NM_139182) is another VGAM2230 host target gene. CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CENTD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2, designated SEQ ID:29201 and SEQ ID:17563 respectively, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76466] Another function of VGAM2230 is therefore inhibition of

Centaurin, Delta 1 (CENTD1, Accession NM_139182), a gene which is nvolved in cell signaling/communication. Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTD1. The function of CENTD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM445.Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession NM_000944) is another VGAM2230 host target gene. PPP3CA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP3CA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP3CA BINDING SITE, designated SEQ ID:6646, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76467] Another function of VGAM2230 is therefore inhibition of Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession

NM_000944), a gene which is the catalytic subunit of calcium-dependent, calmodulin-stimulated protein phosphatase. Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP3CA. The function of PPP3CA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497.Phosphoribosyl Pyrophosphate Synthetase 2 (PRPS2, Accession NM_002765) is another VGAM2230 host target gene. PRPS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPS2 BINDING SITE, designated SEQ ID:8657, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76468] Another function of VGAM2230 is therefore inhibition of Phosphoribosyl Pyrophosphate Synthetase 2 (PRPS2, Accession NM_002765), a gene which generates the PRPP needed for initiation of purine biosynthesis. Accordingly,

utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPS2. The function of PRPS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM828.RNA Binding Motif Protein 8A (RBM8A, Accession NM_005105) is another VGAM2230 host target gene. RBM8A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBM8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM8A BINDING SITE, designated SEQ ID:11581, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76469] Another function of VGAM2230 is therefore inhibition of RNA Binding Motif Protein 8A (RBM8A, Accession NM_005105), a gene which involves in the pathway of gene expression postsplicing nuclear preexport mRNPs, and newly exported cytoplasmic mRNPs. Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with RBM8A. The function of RBM8A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1864.V-yes-1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM_005433) is another VGAM2230 host target gene. YES1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YES1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YES1 BINDING SITE, designated SEQ ID:11915, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76470] Another function of VGAM2230 is therefore inhibition of V-yes-1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM_005433), a gene which is a putative protein-tyrosine kinase. Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YES1. The function of YES1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM74.Calmegin (CLGN, Accession NM_004362) is another VGAM2230 host target gene. CLGN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLGN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLGN BINDING SITE, designated SEQ ID:10569, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76471] Another function of VGAM2230 is therefore inhibition of Calmegin (CLGN, Accession NM_004362). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLGN. Cyclin M1 (CNNM1, Accession NM_020348) is another VGAM2230 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21610, to the nucleotide sequence of VGAM2230 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4941.

[76472] Another function of VGAM2230 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM_020348). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. DKFZp434C0923 (Accession NM_017598) is another VGAM2230 host target gene. DKFZp434C0923 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434C0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0923 BINDING SITE, designated SEQ ID:19066, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76473] Another function of VGAM2230 is therefore inhibition of DKFZp434C0923 (Accession NM_017598). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0923. FLJ10704 (Accession NM_018185) is another VGAM2230 host target gene. FLJ10704 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by FLJ10704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10704 BINDING SITE, designated SEQ ID:20034, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76474] Another function of VGAM2230 is therefore inhibition of FLJ10704 (Accession NM_018185). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10704. FLJ11267 (Accession NM_019607) is another VGAM2230 host target gene. FLJ11267 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11267 BINDING SITE, designated SEQ ID:21225, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76475] Another function of VGAM2230 is therefore inhibition of FLJ11267 (Accession NM_019607). Accordingly, utilities of

VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11267. FLJ13962 (Accession NM_024862) is another VGAM2230 host target gene. FLJ13962 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13962 BINDING SITE, designated SEQ ID:24298, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76476] Another function of VGAM2230 is therefore inhibition of FLJ13962 (Accession NM_024862). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13962. FLJ20413 (Accession NM_017808) is another VGAM2230 host target gene. FLJ20413 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20413

BINDING SITE, designated SEQ ID:19455, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76477] Another function of VGAM2230 is therefore inhibition of FLJ20413 (Accession NM_017808). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20413. FLJ20729 (Accession NM_017953) is another VGAM2230 host target gene. FLJ20729 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20729 BINDING SITE, designated SEQ ID:19657, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76478] Another function of VGAM2230 is therefore inhibition of FLJ20729 (Accession NM_017953). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20729. KIAA0237 (Accession NM_014747) is another VGAM2230 host target gene. KIAA0237 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16453, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76479] Another function of VGAM2230 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0746 (Accession XM_045277) is another VGAM2230 host target gene. KIAA0746 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0746, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0746 BINDING SITE, designated SEQ ID:34415, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76480] Another function of VGAM2230 is therefore inhibition of

KIAA0746 (Accession XM_045277). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0746. KIAA0788 (Accession XM_049108) is another VGAM2230 host target gene. KIAA0788 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0788, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0788 BINDING SITE, designated SEQ ID:35344, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76481] Another function of VGAM2230 is therefore inhibition of KIAA0788 (Accession XM_049108). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0788. KIAA0795 (Accession NM_025010) is another VGAM2230 host target gene. KIAA0795 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0795 BINDING SITE, designated SEQ ID:24586, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76482] Another function of VGAM2230 is therefore inhibition of KIAA0795 (Accession NM_025010). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0795. KIAA1977 (Accession XM_058800) is another VGAM2230 host target gene. KIAA1977 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1977 BINDING SITE, designated SEQ ID:36746, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76483] Another function of VGAM2230 is therefore inhibition of KIAA1977 (Accession XM_058800). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1977. KR18 (Accession NM_033288) is another

VGAM2230 host target gene. KR18 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KR18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KR18 BINDING SITE, designated SEQ ID:27121, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76484] Another function of VGAM2230 is therefore inhibition of KR18 (Accession NM_033288). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KR18. LIG-1 (Accession XM_033712) is another VGAM2230 host target gene. LIG-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIG-1 BINDING SITE, designated SEQ ID:31954, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76485] Another function of VGAM2230 is therefore inhibition of LIG-1 (Accession XM_033712). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIG-1. Nucleoporin 133kDa (NUP133, Accession NM_018230) is another VGAM2230 host target gene. NUP133 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUP133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP133 BINDING SITE, designated SEQ ID:20168, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76486] Another function of VGAM2230 is therefore inhibition of Nucleoporin 133kDa (NUP133, Accession NM_018230). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP133. Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007) is another VGAM2230 host target gene. PLAGL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLAGL2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL2 BINDING SITE, designated SEQ ID:34880, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76487] Another function of VGAM2230 is therefore inhibition of Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL2. RAN, Member RAS Oncogene Family (RAN, Accession NM_006325) is another VGAM2230 host target gene. RAN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAN BINDING SITE, designated SEQ ID:13017, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76488] Another function of VGAM2230 is therefore inhibition of RAN, Member RAS Oncogene Family (RAN, Accession

NM_006325). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAN. Roundabout, Axon Guidance Receptor, Homolog 2 (Drosophila) (ROBO2, Accession XM_031246) is another VGAM2230 host target gene. ROBO2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ROBO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO2 BINDING SITE, designated SEQ ID:31317, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76489] Another function of VGAM2230 is therefore inhibition of Roundabout, Axon Guidance Receptor, Homolog 2 (Drosophila) (ROBO2, Accession XM_031246). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO2. SEC15B (Accession XM_039570) is another VGAM2230 host target gene. SEC15B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC15B, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC15B BINDING SITE, designated SEQ ID:33125, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76490] Another function of VGAM2230 is therefore inhibition of SEC15B (Accession XM_039570). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC15B. SH3 Domain Binding Glutamic Acid-rich Protein Like (SH3BGRL, Accession XM_030373) is another VGAM2230 host target gene. SH3BGRL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3BGRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL BINDING SITE, designated SEQ ID:31027, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76491] Another function of VGAM2230 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like

(SH3BGRL, Accession XM_030373). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL. TRIP-Br2 (Accession NM_014755) is another VGAM2230 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16494, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76492] Another function of VGAM2230 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. LOC157507 (Accession XM_088312) is another VGAM2230 host target gene. LOC157507 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC157507 BINDING SITE, designated SEQ ID:39607, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76493] Another function of VGAM2230 is therefore inhibition of LOC157507 (Accession XM_088312). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157507. LOC161742 (Accession XM_091095) is another VGAM2230 host target gene. LOC161742 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC161742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161742 BINDING SITE, designated SEQ ID:40028, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76494] Another function of VGAM2230 is therefore inhibition of LOC161742 (Accession XM_091095). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161742. LOC162239 (Accession XM_091439) is an-

other VGAM2230 host target gene. LOC162239 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC162239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162239 BINDING SITE, designated SEQ ID:40053, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76495] Another function of VGAM2230 is therefore inhibition of LOC162239 (Accession XM_091439). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162239. LOC199704 (Accession XM_113994) is another VGAM2230 host target gene. LOC199704 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199704 BINDING SITE, designated SEQ ID:42602, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76496] Another function of VGAM2230 is therefore inhibition of LOC199704 (Accession XM_113994). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199704. LOC220469 (Accession XM_084334) is another VGAM2230 host target gene. LOC220469 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220469 BINDING SITE, designated SEQ ID:37554, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76497] Another function of VGAM2230 is therefore inhibition of LOC220469 (Accession XM_084334). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220469. LOC221002 (Accession XM_166156) is another VGAM2230 host target gene. LOC221002 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221002, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221002 BINDING SITE, designated SEQ ID:43975, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76498] Another function of VGAM2230 is therefore inhibition of LOC221002 (Accession XM_166156). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221002. LOC56965 (Accession NM_020213) is another VGAM2230 host target gene. LOC56965 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC56965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56965 BINDING SITE, designated SEQ ID:21454, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76499] Another function of VGAM2230 is therefore inhibition of LOC56965 (Accession NM_020213). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC56965. LOC91050 (Accession XM_035703) is another VGAM2230 host target gene. LOC91050 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91050 BINDING SITE, designated SEQ ID:32337, to the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, also designated SEQ ID:4941.

[76500] Another function of VGAM2230 is therefore inhibition of LOC91050 (Accession XM_035703). Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91050. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2231 (VGAM2231) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76501] VGAM2231 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2231 was detected is described hereinabove with reference to Figs. 1-8.

[76502] VGAM2231 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Aucuba Mosaic Virus. VGAM2231 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76503] VGAM2231 gene encodes a VGAM2231 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2231 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2231 precursor RNA is designated SEQ ID:2217, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2217 is located at position 1079 relative to the genome of Potato Aucuba Mosaic Virus.

[76504] VGAM2231 precursor RNA folds onto itself, forming VGAM2231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76505] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2231 folded precursor RNA into VGAM2231 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2231 RNA is designated SEQ ID:4942, and is provided hereinbelow with reference to the sequence listing part.

[76506] VGAM2231 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2231 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2231 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76507] VGAM2231 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2231 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2231 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2231 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2231 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76508] The complementary binding of VGAM2231 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2231 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2231 host target RNA into VGAM2231 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76509] It is appreciated that VGAM2231 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2231 host target genes. The mRNA of each one of this plurality of VGAM2231 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2231 RNA, herein designated VGAM RNA, and which when bound by VGAM2231 RNA causes inhibition of translation of respective one or more VGAM2231 host target proteins.

[76510] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2231 gene, herein designated VGAM GENE, on one or more VGAM2231 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76511] It is yet further appreciated that a function of VGAM2231 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of viral infection by Potato Aucuba Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2231 correlate with, and may be deduced from, the identity of the host target genes which VGAM2231 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76512] Nucleotide sequences of the VGAM2231 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2231 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2231 are further described hereinbelow with reference to Table 1.

[76513] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2231 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2231 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76514] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2231 gene, herein designated VGAM is inhibition of expression of VGAM2231 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2231 correlate with, and may be deduced from, the identity of the target genes which VGAM2231 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76515] ATPase, Na+/K+ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702) is a VGAM2231 host target gene. ATP1A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA en-

coded by ATP1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1A2 BINDING SITE, designated SEQ ID:6367, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76516] A function of VGAM2231 is therefore inhibition of ATPase, Na+/K+ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1A2. Protocadherin Alpha 9 (PCDHA9, Accession NM_014005) is another VGAM2231 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:15214, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76517] Another function of VGAM2231 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_014005), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71.Protein Tyrosine Phosphatase, Receptor Type, A (PTPRA, Accession NM_002836) is another VGAM2231 host target gene. PTPRA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTPRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRA BINDING SITE, designated SEQ ID:8715, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76518] Another function of VGAM2231 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, A (PTPRA, Accession NM_002836), a gene which is the human homolog of the murine PTPase. Accordingly, utilities of

VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRA. The function of PTPRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1205.Splicing Factor, Arginine/serine-rich 1 (splicing factor 2, alternate splicing factor) (SFRS1, Accession NM_006924) is another VGAM2231 host target gene. SFRS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFRS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS1 BINDING SITE, designated SEQ ID:13803, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76519] Another function of VGAM2231 is therefore inhibition of Splicing Factor, Arginine/serine-rich 1 (splicing factor 2, alternate splicing factor) (SFRS1, Accession NM_006924), a gene which plays an essential role in pre-mRNA splicing. Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS1. The function of SFRS1 and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.Solute Carrier Family 22 (extraneuronal monoamine transporter), Member 3 (SLC22A3, Accession NM_021977) is another VGAM2231 host target gene. SLC22A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC22A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A3 BINDING SITE, designated SEQ ID:22504, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76520] Another function of VGAM2231 is therefore inhibition of Solute Carrier Family 22 (extraneuronal monoamine transporter), Member 3 (SLC22A3, Accession NM_021977), a gene which is a sodium-ion dependent, high affinity carnitine transporter. also transports organic cations without the involvement of sodium. involved in the active cellular uptake of carnitine. Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A3. The

function of SLC22A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2147.Vanin 1 (VNN1, Accession NM_004666) is another VGAM2231 host target gene. VNN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VNN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VNN1 BINDING SITE, designated SEQ ID:11040, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76521] Another function of VGAM2231 is therefore inhibition of Vanin 1 (VNN1, Accession NM_004666), a gene which may regulate steps in thymus homing and play a role in mammalian sexual development. Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VNN1. The function of VNN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419.Zinc Finger Protein 124 (HZF-16) (ZNF124,

Accession NM_003431) is another VGAM2231 host target gene. ZNF124 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF124, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF124 BINDING SITE, designated SEQ ID:9484, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76522] Another function of VGAM2231 is therefore inhibition of Zinc Finger Protein 124 (HZF-16) (ZNF124, Accession NM_003431). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF124. Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM_003678) is another VGAM2231 host target gene. C22orf19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C22orf19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf19 BINDING SITE, designated SEQ

ID:9776, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76523] Another function of VGAM2231 is therefore inhibition of Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM_003678). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf19. Chromosome 8 Open Reading Frame 2 (C8orf2, Accession NM_007175) is another VGAM2231 host target gene. C8orf2 BINDING SITE1 and C8orf2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C8orf2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf2 BINDING SITE1 and C8orf2 BINDING SITE2, designated SEQ ID:14024 and SEQ ID:14025 respectively, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76524] Another function of VGAM2231 is therefore inhibition of Chromosome 8 Open Reading Frame 2 (C8orf2, Accession NM_007175). Accordingly, utilities of VGAM2231 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf2. FLJ23132 (Accession XM_171194) is another VGAM2231 host target gene. FLJ23132 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23132 BINDING SITE, designated SEQ ID:45982, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76525] Another function of VGAM2231 is therefore inhibition of FLJ23132 (Accession XM_171194). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23132. HRD1 (Accession XM_045498) is another VGAM2231 host target gene. HRD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRD1 BINDING SITE,

designated SEQ ID:34475, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76526] Another function of VGAM2231 is therefore inhibition of HRD1 (Accession XM_045498). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRD1. KIAA0009 (Accession NM_014637) is another VGAM2231 host target gene. KIAA0009 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0009 BINDING SITE, designated SEQ ID:16022, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76527] Another function of VGAM2231 is therefore inhibition of KIAA0009 (Accession NM_014637). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0009. MGC13523 (Accession NM_033411) is another VGAM2231 host target gene. MGC13523 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC13523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13523 BINDING SITE, designated SEQ ID:27234, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76528] Another function of VGAM2231 is therefore inhibition of MGC13523 (Accession NM_033411). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13523. LOC150481 (Accession XM_086929) is another VGAM2231 host target gene. LOC150481 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150481 BINDING SITE, designated SEQ ID:38979, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76529] Another function of VGAM2231 is therefore inhibition of

LOC150481 (Accession XM_086929). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150481. LOC158191 (Accession XM_088505) is another VGAM2231 host target gene. LOC158191 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158191 BINDING SITE, designated SEQ ID:39758, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76530] Another function of VGAM2231 is therefore inhibition of LOC158191 (Accession XM_088505). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158191. LOC201516 (Accession XM_113974) is another VGAM2231 host target gene. LOC201516 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC201516 BINDING SITE, designated SEQ ID:42582, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76531] Another function of VGAM2231 is therefore inhibition of LOC201516 (Accession XM_113974). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201516. LOC219672 (Accession XM_166111) is another VGAM2231 host target gene. LOC219672 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219672 BINDING SITE, designated SEQ ID:43890, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76532] Another function of VGAM2231 is therefore inhibition of LOC219672 (Accession XM_166111). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219672. LOC219988 (Accession XM_166223) is an-

other VGAM2231 host target gene. LOC219988 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219988 BINDING SITE, designated SEQ ID:44042, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76533] Another function of VGAM2231 is therefore inhibition of LOC219988 (Accession XM_166223). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219988. LOC90190 (Accession XM_029758) is another VGAM2231 host target gene. LOC90190 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90190 BINDING SITE, designated SEQ ID:30947, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76534] Another function of VGAM2231 is therefore inhibition of LOC90190 (Accession XM_029758). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90190. LOC91380 (Accession XM_038134) is another VGAM2231 host target gene. LOC91380 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91380, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91380 BINDING SITE, designated SEQ ID:32758, to the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, also designated SEQ ID:4942.

[76535] Another function of VGAM2231 is therefore inhibition of LOC91380 (Accession XM_038134). Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91380. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2232 (VGAM2232) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[76536] VGAM2232 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2232 was detected is described hereinabove with reference to Figs. 1-8.

[76537] VGAM2232 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2232 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76538] VGAM2232 gene encodes a VGAM2232 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2232 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2232 precursor RNA is designated SEQ ID:2218, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2218 is located at position 2170 relative to the genome of Porcine Epidemic Diarrhea Virus.

[76539] VGAM2232 precursor RNA folds onto itself, forming VGAM2232 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76540] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2232 folded precursor RNA into VGAM2232 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2232 RNA is designated SEQ ID:4943, and is provided hereinbelow with reference to the sequence listing part.

[76541] VGAM2232 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2232 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2232 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76542] VGAM2232 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2232 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2232 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2232 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2232 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76543] The complementary binding of VGAM2232 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2232 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2232 host target RNA into VGAM2232 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76544] It is appreciated that VGAM2232 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2232 host target genes. The mRNA of each one of this plurality of VGAM2232 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2232 RNA, herein designated VGAM RNA, and which when bound by VGAM2232 RNA causes inhibition of translation of respective one or more VGAM2232 host target proteins.

[76545] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2232 gene, herein designated VGAM GENE, on one or more VGAM2232 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76546] It is yet further appreciated that a function of VGAM2232 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM2232 correlate with, and may be deduced from, the identity of the host target genes which VGAM2232 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[76547] Nucleotide sequences of the VGAM2232 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2232 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2232 are further described hereinbelow with reference to Table 1.

[76548] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2232 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2232 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76549] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2232 gene, herein designated VGAM is inhibition of expression of VGAM2232 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2232 correlate with, and may be deduced from, the identity of the target genes which VGAM2232 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76550] ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052) is a VGAM2232 host target gene. ATP7A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE, designated SEQ ID:5494, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76551] A function of VGAM2232 is therefore inhibition of ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A. Branched Chain Aminotransferase 1, Cytosolic (BCAT1, Accession XM_038659) is another VGAM2232 host target gene. BCAT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of BCAT1 BINDING SITE, designated SEQ ID:32894, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76552] Another function of VGAM2232 is therefore inhibition of Branched Chain Aminotransferase 1, Cytosolic (BCAT1, Accession XM_038659), a gene which catalyzes of the essential branched chain leucine, isoleucine, and valine. Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCAT1. The function of BCAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1367.Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193) is another VGAM2232 host target gene. FZD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FZD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ ID:14481, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4943.

[76553] Another function of VGAM2232 is therefore inhibition of Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled receptor family, has seven transmembrane domains. Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD4. The function of FZD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309.Mitogen-activated Protein Kinase 1 (MAPK1, Accession NM_002745) is another VGAM2232 host target gene. MAPK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK1 BINDING SITE, designated SEQ ID:8618, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76554] Another function of VGAM2232 is therefore inhibition of

Mitogen-activated Protein Kinase 1 (MAPK1, Accession NM_002745), a gene which phosphorylates microtubule-associated protein-2 (map2). myelin basic protein (mbp), and elk-1; may promote entry in the cell cycle. Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK1. The function of MAPK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217.RAD52 Homolog (S. cerevisiae) (RAD52, Accession NM_134422) is another VGAM2232 host target gene. RAD52 BINDING SITE1 through RAD52 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD52, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE1 through RAD52 BINDING SITE3, designated SEQ ID:28641, SEQ ID:28651 and SEQ ID:28660 respectively, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76555] Another function of VGAM2232 is therefore inhibition of

RAD52 Homolog (S. cerevisiae) (RAD52, Accession NM_134422). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52. DKFZP434C171 (Accession NM_015621) is another VGAM2232 host target gene. DKFZP434C171 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434C171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C171 BINDING SITE, designated SEQ ID:17881, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76556] Another function of VGAM2232 is therefore inhibition of DKFZP434C171 (Accession NM_015621). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C171. KIAA0285 (Accession NM_014807) is another VGAM2232 host target gene. KIAA0285 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0285, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0285 BINDING SITE, designated SEQ ID:16747, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76557] Another function of VGAM2232 is therefore inhibition of KIAA0285 (Accession NM_014807). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0285. KIAA0408 (Accession NM_014702) is another VGAM2232 host target gene. KIAA0408 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0408 BINDING SITE, designated SEQ ID:16237, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76558] Another function of VGAM2232 is therefore inhibition of KIAA0408 (Accession NM_014702). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0408. KIAA1871 (Accession XM_028409) is another VGAM2232 host target gene. KIAA1871 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1871 BINDING SITE, designated SEQ ID:30707, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76559] Another function of VGAM2232 is therefore inhibition of KIAA1871 (Accession XM_028409). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1871. Phosphatase, Orphan 1 (phospho1, Accession XM_091572) is another VGAM2232 host target gene. phospho1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by phospho1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of phospho1 BINDING SITE, designated SEQ ID:40065, to the nucleotide sequence of VGAM2232 RNA,

herein designated VGAM RNA, also designated SEQ ID:4943.

[76560] Another function of VGAM2232 is therefore inhibition of Phosphatase, Orphan 1 (phospho1, Accession XM_091572). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with phospho1. PPI5PIV (Accession NM_019892) is another VGAM2232 host target gene. PPI5PIV BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPI5PIV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPI5PIV BINDING SITE, designated SEQ ID:21273, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76561] Another function of VGAM2232 is therefore inhibition of PPI5PIV (Accession NM_019892). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPI5PIV. Thiamine Triphosphatase (THTPA, Accession NM_024328) is another VGAM2232 host target gene. THTPA BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by THTPA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THTPA BINDING SITE, designated SEQ ID:23621, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76562] Another function of VGAM2232 is therefore inhibition of Thiamine Triphosphatase (THTPA, Accession NM_024328). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THTPA. TSPEAR (Accession NM_144991) is another VGAM2232 host target gene. TSPEAR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TSPEAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSPEAR BINDING SITE, designated SEQ ID:29594, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76563] Another function of VGAM2232 is therefore inhibition of TSPEAR (Accession NM_144991). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSPEAR. Zinc Finger Protein 297B (ZNF297B, Accession XM_088524) is another VGAM2232 host target gene. ZNF297B BINDING SITE1 and ZNF297B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZNF297B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF297B BINDING SITE1 and ZNF297B BINDING SITE2, designated SEQ ID:39769 and SEQ ID:15218 respectively, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76564] Another function of VGAM2232 is therefore inhibition of Zinc Finger Protein 297B (ZNF297B, Accession XM_088524). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF297B. LOC146520 (Accession XM_085492) is another VGAM2232 host target gene. LOC146520 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by LOC146520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146520 BINDING SITE, designated SEQ ID:38188, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76565] Another function of VGAM2232 is therefore inhibition of LOC146520 (Accession XM_085492). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146520. LOC149566 (Accession XM_097670) is another VGAM2232 host target gene. LOC149566 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149566 BINDING SITE, designated SEQ ID:41013, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76566] Another function of VGAM2232 is therefore inhibition of

LOC149566 (Accession XM_097670). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149566. LOC155435 (Accession XM_088257) is another VGAM2232 host target gene. LOC155435 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155435 BINDING SITE, designated SEQ ID:39565, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76567] Another function of VGAM2232 is therefore inhibition of LOC155435 (Accession XM_088257). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155435. LOC202460 (Accession XM_114493) is another VGAM2232 host target gene. LOC202460 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC202460 BINDING SITE, designated SEQ ID:42981, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76568] Another function of VGAM2232 is therefore inhibition of LOC202460 (Accession XM_114493). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202460. LOC203080 (Accession XM_114623) is another VGAM2232 host target gene. LOC203080 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203080, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203080 BINDING SITE, designated SEQ ID:43003, to the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, also designated SEQ ID:4943.

[76569] Another function of VGAM2232 is therefore inhibition of LOC203080 (Accession XM_114623). Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203080. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2233 (VGAM2233) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76570] VGAM2233 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2233 was detected is described hereinabove with reference to Figs. 1-8.

[76571] VGAM2233 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2233 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76572] VGAM2233 gene encodes a VGAM2233 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2233 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2233 precursor RNA is designated SEQ ID:2219, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2219 is located at position 17365 relative to the genome of Porcine Epidemic Diarrhea Virus.

[76573] VGAM2233 precursor RNA folds onto itself, forming VGAM2233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76574] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2233 folded precursor RNA into VGAM2233 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2233 RNA is designated SEQ ID:4944, and is provided hereinbelow with reference to the sequence listing part.

[76575] VGAM2233 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2233 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2233 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76576] VGAM2233 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2233 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2233 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2233 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2233 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76577] The complementary binding of VGAM2233 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2233 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2233 host target RNA into VGAM2233 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76578] It is appreciated that VGAM2233 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2233 host target genes. The mRNA of each one of this plurality of VGAM2233 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2233 RNA, herein designated VGAM RNA, and which when bound by VGAM2233 RNA causes inhibition of translation of respective one or more

VGAM2233 host target proteins.

[76579] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2233 gene, herein designated VGAM GENE, on one or more VGAM2233 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76580] It is yet further appreciated that a function of VGAM2233 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea

Virus. Specific functions, and accordingly utilities, of VGAM2233 correlate with, and may be deduced from, the identity of the host target genes which VGAM2233 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76581] Nucleotide sequences of the VGAM2233 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2233 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2233 are further described hereinbelow with reference to Table 1.

[76582] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2233 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2233 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76583] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2233 gene, herein designated VGAM is inhibition of expression of VGAM2233 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2233 correlate with, and may be deduced from, the identity of the target genes which VGAM2233 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76584] SRY (sex determining region Y)-box 12 (SOX12, Accession NM_006943) is a VGAM2233 host target gene. SOX12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX12 BINDING SITE, designated SEQ ID:13829, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76585] A function of VGAM2233 is therefore inhibition of SRY (sex determining region Y)-box 12 (SOX12, Accession NM_006943). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX12. Bromodomain and PHD Finger Containing, 3 (BRPF3, Accession XM_166450) is another VGAM2233 host target gene. BRPF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BRPF3, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRPF3 BINDING SITE, designated SEQ ID:44344, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76586] Another function of VGAM2233 is therefore inhibition of Bromodomain and PHD Finger Containing, 3 (BRPF3, Accession XM_166450). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRPF3. KIAA1202 (Accession XM_050478) is another VGAM2233 host target gene. KIAA1202 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1202 BINDING SITE, designated SEQ ID:35638, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76587] Another function of VGAM2233 is therefore inhibition of KIAA1202 (Accession XM_050478). Accordingly, utilities

of VGAM2233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1202. Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM_046054) is another VGAM2233 host target gene. LHFPL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LHFPL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHFPL2 BINDING SITE, designated SEQ ID:34658, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76588] Another function of VGAM2233 is therefore inhibition of Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM_046054). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHFPL2. MGC1842 (Accession XM_037797) is another VGAM2233 host target gene. MGC1842 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC1842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC1842 BINDING SITE, designated SEQ ID:32684, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76589] Another function of VGAM2233 is therefore inhibition of MGC1842 (Accession XM_037797). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1842. p21(CDKN1A)-activated Kinase 7 (PAK7, Accession XM_045653) is another VGAM2233 host target gene. PAK7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK7 BINDING SITE, designated SEQ ID:34509, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76590] Another function of VGAM2233 is therefore inhibition of p21(CDKN1A)-activated Kinase 7 (PAK7, Accession XM_045653). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PAK7. RALGPS1A (Accession NM_014636) is another VGAM2233 host target gene. RALGPS1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RALGPS1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALGPS1A BINDING SITE, designated SEQ ID:16014, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76591] Another function of VGAM2233 is therefore inhibition of RALGPS1A (Accession NM_014636). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALGPS1A. Serine Protease Inhibitor-like, with Kunitz and WAP Domains 1 (eppin) (SPINLW1, Accession NM_020398) is another VGAM2233 host target gene. SPINLW1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPINLW1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SPINLW1 BINDING SITE, designated SEQ ID:21666, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76592] Another function of VGAM2233 is therefore inhibition of Serine Protease Inhibitor-like, with Kunitz and WAP Domains 1 (eppin) (SPINLW1, Accession NM_020398). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPINLW1. LOC127435 (Accession XM_072088) is another VGAM2233 host target gene. LOC127435 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC127435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127435 BINDING SITE, designated SEQ ID:37460, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76593] Another function of VGAM2233 is therefore inhibition of LOC127435 (Accession XM_072088). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC127435. LOC144866 (Accession XM_096699) is another VGAM2233 host target gene. LOC144866 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144866 BINDING SITE, designated SEQ ID:40474, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76594] Another function of VGAM2233 is therefore inhibition of LOC144866 (Accession XM_096699). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144866. LOC163231 (Accession XM_092094) is another VGAM2233 host target gene. LOC163231 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC163231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163231 BINDING SITE, designated SEQ ID:40091, to the nucleotide sequence of VGAM2233 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4944.

[76595] Another function of VGAM2233 is therefore inhibition of LOC163231 (Accession XM_092094). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163231. LOC201952 (Accession XM_117345) is another VGAM2233 host target gene. LOC201952 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201952 BINDING SITE, designated SEQ ID:43393, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76596] Another function of VGAM2233 is therefore inhibition of LOC201952 (Accession XM_117345). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201952. LOC253675 (Accession XM_172990) is another VGAM2233 host target gene. LOC253675 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253675, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253675 BINDING SITE, designated SEQ ID:46264, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76597] Another function of VGAM2233 is therefore inhibition of LOC253675 (Accession XM_172990). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253675. LOC92080 (Accession XM_042704) is another VGAM2233 host target gene. LOC92080 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92080, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92080 BINDING SITE, designated SEQ ID:33756, to the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, also designated SEQ ID:4944.

[76598] Another function of VGAM2233 is therefore inhibition of LOC92080 (Accession XM_042704). Accordingly, utilities of VGAM2233 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC92080. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2234 (VGAM2234) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76599] VGAM2234 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2234 was detected is described hereinabove with reference to Figs. 1-8.

[76600] VGAM2234 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2234 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76601] VGAM2234 gene encodes a VGAM2234 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2234 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2234 precursor RNA is desig-

nated SEQ ID:2220, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2220 is located at position 15172 relative to the genome of Porcine Epidemic Diarrhea Virus.

[76602] VGAM2234 precursor RNA folds onto itself, forming VGAM2234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76603] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2234 folded precursor RNA into VGAM2234 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2234 RNA is designated SEQ ID:4945, and is provided hereinbelow with reference to the sequence

listing part.

[76604] VGAM2234 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2234 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2234 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76605] VGAM2234 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2234 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2234 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2234 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2234 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76606] The complementary binding of VGAM2234 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2234 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2234 host target RNA into VGAM2234 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76607] It is appreciated that VGAM2234 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2234 host target genes. The mRNA of each one of this plurality of VGAM2234 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2234 RNA, herein designated VGAM

RNA, and which when bound by VGAM2234 RNA causes inhibition of translation of respective one or more VGAM2234 host target proteins.

[76608] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2234 gene, herein designated VGAM GENE, on one or more VGAM2234 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76609] It is yet further appreciated that a function of VGAM2234 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2234 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM2234 correlate with, and may be deduced from, the identity of the host target genes which VGAM2234 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76610] Nucleotide sequences of the VGAM2234 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2234 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2234 are further described hereinbelow with reference to Table 1.

[76611] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2234 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2234 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76612] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2234 gene, herein designated VGAM is

inhibition of expression of VGAM2234 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2234 correlate with, and may be deduced from, the identity of the target genes which VGAM2234 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76613] Ankyrin 3, Node of Ranvier (ankyrin G) (ANK3, Accession NM_020987) is a VGAM2234 host target gene. ANK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ANK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK3 BINDING SITE, designated SEQ ID:21982, to the nucleotide sequence of VGAM2234 RNA, herein designated VGAM RNA, also designated SEQ ID:4945.

[76614] A function of VGAM2234 is therefore inhibition of Ankyrin 3, Node of Ranvier (ankyrin G) (ANK3, Accession NM_020987), a gene which plays key roles in activities such as cell motility, activation, proliferation. Accordingly, utilities of VGAM2234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK3. The function of ANK3 and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1527.EPB72 (Accession NM_004099) is another VGAM2234 host target gene. EPB72 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPB72, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB72 BINDING SITE, designated SEQ ID:10305, to the nucleotide sequence of VGAM2234 RNA, herein designated VGAM RNA, also designated SEQ ID:4945.

[76615] Another function of VGAM2234 is therefore inhibition of EPB72 (Accession NM_004099), a gene which may regulate cation conductance. Accordingly, utilities of VGAM2234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB72. The function of EPB72 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1560.A Kinase (PRKA) Anchor Protein 6 (AKAP6, Accession NM_004274) is another VGAM2234 host target gene. AKAP6 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by AKAP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP6 BINDING SITE, designated SEQ ID:10489, to the nucleotide sequence of VGAM2234 RNA, herein designated VGAM RNA, also designated SEQ ID:4945.

[76616] Another function of VGAM2234 is therefore inhibition of A Kinase (PRKA) Anchor Protein 6 (AKAP6, Accession NM_004274). Accordingly, utilities of VGAM2234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP6. Kelch-like 8 (Drosophila) (KLHL8, Accession XM_031735) is another VGAM2234 host target gene. KLHL8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KLHL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL8 BINDING SITE, designated SEQ ID:31476, to the nucleotide sequence of VGAM2234 RNA, herein designated VGAM RNA, also designated SEQ ID:4945.

[76617] Another function of VGAM2234 is therefore inhibition of Kelch-like 8 (Drosophila) (KLHL8, Accession XM_031735). Accordingly, utilities of VGAM2234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL8. LOC200150 (Accession XM_114131) is another VGAM2234 host target gene. LOC200150 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200150 BINDING SITE, designated SEQ ID:42711, to the nucleotide sequence of VGAM2234 RNA, herein designated VGAM RNA, also designated SEQ ID:4945.

[76618] Another function of VGAM2234 is therefore inhibition of LOC200150 (Accession XM_114131). Accordingly, utilities of VGAM2234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200150. LOC257319 (Accession XM_171049) is another VGAM2234 host target gene. LOC257319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257319, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257319 BINDING SITE, designated SEQ ID:45834, to the nucleotide sequence of VGAM2234 RNA, herein designated VGAM RNA, also designated SEQ ID:4945.

[76619] Another function of VGAM2234 is therefore inhibition of LOC257319 (Accession XM_171049). Accordingly, utilities of VGAM2234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257319. LOC89932 (Accession XM_027341) is another VGAM2234 host target gene. LOC89932 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC89932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89932 BINDING SITE, designated SEQ ID:30491, to the nucleotide sequence of VGAM2234 RNA, herein designated VGAM RNA, also designated SEQ ID:4945.

[76620] Another function of VGAM2234 is therefore inhibition of LOC89932 (Accession XM_027341). Accordingly, utilities of VGAM2234 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC89932. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2235 (VGAM2235) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76621] VGAM2235 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2235 was detected is described hereinabove with reference to Figs. 1-8.

[76622] VGAM2235 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2235 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76623] VGAM2235 gene encodes a VGAM2235 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2235 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2235 precursor RNA is desig-

nated SEQ ID:2221, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2221 is located at position 19252 relative to the genome of Porcine Epidemic Diarrhea Virus.

[76624] VGAM2235 precursor RNA folds onto itself, forming VGAM2235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76625] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2235 folded precursor RNA into VGAM2235 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2235 RNA is designated SEQ ID:4946, and is provided hereinbelow with reference to the sequence

listing part.

[76626] VGAM2235 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2235 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2235 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76627] VGAM2235 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2235 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2235 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2235 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2235 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76628] The complementary binding of VGAM2235 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2235 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2235 host target RNA into VGAM2235 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76629] It is appreciated that VGAM2235 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2235 host target genes. The mRNA of each one of this plurality of VGAM2235 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2235 RNA, herein designated VGAM

RNA, and which when bound by VGAM2235 RNA causes inhibition of translation of respective one or more VGAM2235 host target proteins.

[76630] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2235 gene, herein designated VGAM GENE, on one or more VGAM2235 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76631] It is yet further appreciated that a function of VGAM2235 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2235 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM2235 correlate with, and may be deduced from, the identity of the host target genes which VGAM2235 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76632] Nucleotide sequences of the VGAM2235 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2235 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2235 are further described hereinbelow with reference to Table 1.

[76633] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2235 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2235 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76634] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2235 gene, herein designated VGAM is

inhibition of expression of VGAM2235 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2235 correlate with, and may be deduced from, the identity of the target genes which VGAM2235 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76635] Arachidonate 15-lipoxygenase (ALOX15, Accession NM_001140) is a VGAM2235 host target gene. ALOX15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALOX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALOX15 BINDING SITE, designated SEQ ID:6808, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76636] A function of VGAM2235 is therefore inhibition of Arachidonate 15-lipoxygenase (ALOX15, Accession NM_001140), a gene which converts arachidonic acid to 15s- hydroperoxyeicosatetraenoic acid. Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with ALOX15. The function of ALOX15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM282.ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933) is another VGAM2235 host target gene. ATP8B2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ATP8B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:32515, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76637] Another function of VGAM2235 is therefore inhibition of ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933). Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858) is another VGAM2235 host target gene. COL19A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL19A1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL19A1 BINDING SITE, designated SEQ ID:7598, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76638] Another function of VGAM2235 is therefore inhibition of Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858), a gene which may act as a cross-bridge between fibrils and other extracellular matrix molecules. Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL19A1. The function of COL19A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM19.Carboxypeptidase N, Polypeptide 1, 50kD (CPN1, Accession NM_001308) is another VGAM2235 host target gene. CPN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CPN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of CPN1 BINDING SITE, designated SEQ ID:6990, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76639] Another function of VGAM2235 is therefore inhibition of Carboxypeptidase N, Polypeptide 1, 50kD (CPN1, Accession NM_001308), a gene which cleaves basic amino acid residues from the C terminal of peptides and proteins. Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPN1. The function of CPN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1965.Catenin (cadherin-associated protein), Delta 2 (neural plakophilin-related arm-repeat protein) (CTNND2, Accession NM_001332) is another VGAM2235 host target gene. CTNND2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTNND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNND2 BINDING SITE, designated SEQ ID:7014, to the nucleotide sequence of VGAM2235 RNA,

herein designated VGAM RNA, also designated SEQ ID:4946.

[76640] Another function of VGAM2235 is therefore inhibition of Catenin (cadherin-associated protein), Delta 2 (neural plakophilin-related arm-repeat protein) (CTNND2, Accession NM_001332), a gene which interacts with presenilin 1 (PSEN1) and is a member of the plakoglobin/armadillo family. Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNND2. The function of CTNND2 has been established by previous studies. Armadillo-like proteins are characterized by a series of armadillo repeats, first defined in the Drosophila 'armadillo' gene product, that are typically 42 to 45 amino acids long. These proteins can be divided into subfamilies based on the number of repeats, their overall sequence similarity, and the dispersion of the repeats throughout their sequences. Members of the p120(ctn)/plakophilin subfamily of Armadillo-like proteins, including CTNND1 (OMIM Ref. No. 601045), CTNND2, PKP1 (OMIM Ref. No. 601975), PKP2 (OMIM Ref. No. 602861), PKP4 (OMIM Ref. No. 604276), and ARVCF (OMIM Ref. No. 602269), have 10 armadillo repeats each In a search for proteins with se-

quence homology to PKP1, Paffenholz and Franke (1997) identified a human cDNA with 45% amino acid identity to PKP1 in a segment within the armadillo (arm) repeat units. Antibodies raised against the arm repeat region recognized 2 polypeptide bands of approximately 150 and 160 kD in immunoblots of mouse brain and a weak band of approximately 160 kD in mouse skeletal muscle and pancreas. The authors, therefore, named the protein NPRAP for 'neural plakophilin-related arm-repeat protein.' Paffenholz and Franke (1997) isolated 2 partial human cDNA clones from a human fetal brain cDNA library. The longer displays 91% identity to the complete mouse cDNA. Northern blot analysis of a number of human and bovine cell lines and tissues detected CTNND2 expression as 5- and 6-kb transcripts only in human fetal brain RNA

[76641] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[76642] Paffenholz, R.; Franke, W. W. : Identification and localization of a neurally expressed member of the plakoglobin/armadillo multigene family. Differentiation 61: 293-304, 1997. ; and

[76643] Medina, M.; Marinescu, R. C.; Overhauser, J.; Kosik, K. S. :

Hemizygosity of delta-catenin (CTNND2) is associated with severe mental retardation in cri-du-chat syndrome. Genomics 63: 157.

[76644] Further studies establishing the function and utilities of CTNND2 are found in John Hopkins OMIM database record ID 604275, and in sited publications numbered 702 and 7385-7387 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Interleukin 12 Receptor, Beta 2 (IL12RB2, Accession NM_001559) is another VGAM2235 host target gene. IL12RB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL12RB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL12RB2 BINDING SITE, designated SEQ ID:7279, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76645] Another function of VGAM2235 is therefore inhibition of Interleukin 12 Receptor, Beta 2 (IL12RB2, Accession NM_001559), a gene which is involved in il-12 transduction. binds to il-12 with a low affinity. Accordingly, utili-

ties of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL12RB2. The function of IL12RB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM326.Pre-B-cell Leukemia Transcription Factor 3 (PBX3, Accession NM_006195) is another VGAM2235 host target gene. PBX3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PBX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PBX3 BINDING SITE, designated SEQ ID:12868, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76646] Another function of VGAM2235 is therefore inhibition of Pre-B-cell Leukemia Transcription Factor 3 (PBX3, Accession NM_006195). Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PBX3. Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession NM_000944) is

another VGAM2235 host target gene. PPP3CA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP3CA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP3CA BINDING SITE, designated SEQ ID:6643, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76647] Another function of VGAM2235 is therefore inhibition of Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession NM_000944), a gene which is the catalytic subunit of calcium-dependent, calmodulin-stimulated protein phosphatase. Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP3CA. The function of PPP3CA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497.Peroxisomal Farnesylated Protein (PXF, Accession NM_002857) is another VGAM2235 host target gene. PXF BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by PXF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXF BINDING SITE, designated SEQ ID:8750, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76648] Another function of VGAM2235 is therefore inhibition of Peroxisomal Farnesylated Protein (PXF, Accession NM_002857), a gene which may function in peroxisomal biogenesis or assembly. Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXF. The function of PXF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193.Regulatory Factor X-associated Protein (RFXAP, Accession NM_000538) is another VGAM2235 host target gene. RFXAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RFXAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of RFXAP BINDING SITE, designated SEQ ID:6134, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76649] Another function of VGAM2235 is therefore inhibition of Regulatory Factor X-associated Protein (RFXAP, Accession NM_000538), a gene which binds to the x-box of mhc ii promoters and is a transcriptional regulator. Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFXAP. The function of RFXAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM797.HSA243666 (Accession NM_017582) is another VGAM2235 host target gene. HSA243666 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSA243666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA243666 BINDING SITE, designated SEQ ID:19019, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4946.

[76650] Another function of VGAM2235 is therefore inhibition of HSA243666 (Accession NM_017582). Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA243666. MCM10 Minichromosome Maintenance Deficient 10 (S. cerevisiae) (MCM10, Accession NM_018518) is another VGAM2235 host target gene. MCM10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MCM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCM10 BINDING SITE, designated SEQ ID:20592, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76651] Another function of VGAM2235 is therefore inhibition of MCM10 Minichromosome Maintenance Deficient 10 (S. cerevisiae) (MCM10, Accession NM_018518). Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCM10. Neuropilin (NRP) and Tolloid (TLL)-like 1 (NETO1, Accession NM_138966) is another VGAM2235

host target gene. NETO1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NETO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NETO1 BINDING SITE, designated SEQ ID:29070, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76652] Another function of VGAM2235 is therefore inhibition of Neuropilin (NRP) and Tolloid (TLL)-like 1 (NETO1, Accession NM_138966). Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NETO1. PEPP3 (Accession NM_014935) is another VGAM2235 host target gene. PEPP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PEPP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEPP3 BINDING SITE, designated SEQ ID:17233, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76653] Another function of VGAM2235 is therefore inhibition of PEPP3 (Accession NM_014935). Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEPP3. ZID (Accession NM_006626) is another VGAM2235 host target gene. ZID BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZID, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZID BINDING SITE, designated SEQ ID:13414, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76654] Another function of VGAM2235 is therefore inhibition of ZID (Accession NM_006626). Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZID. Zinc Finger Protein 237 (ZNF237, Accession NM_014242) is another VGAM2235 host target gene. ZNF237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of ZNF237 BINDING SITE, designated SEQ ID:15504, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76655] Another function of VGAM2235 is therefore inhibition of Zinc Finger Protein 237 (ZNF237, Accession NM_014242). Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF237. LOC122786 (Accession XM_058660) is another VGAM2235 host target gene. LOC122786 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC122786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122786 BINDING SITE, designated SEQ ID:36697, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76656] Another function of VGAM2235 is therefore inhibition of LOC122786 (Accession XM_058660). Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC122786. LOC124801 (Accession XM_058850) is another VGAM2235 host target gene. LOC124801 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124801, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124801 BINDING SITE, designated SEQ ID:36762, to the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, also designated SEQ ID:4946.

[76657] Another function of VGAM2235 is therefore inhibition of LOC124801 (Accession XM_058850). Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124801. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2236 (VGAM2236) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76658] VGAM2236 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2236 was detected is described hereinabove with reference to Figs. 1-8.

[76659] VGAM2236 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2236 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76660] VGAM2236 gene encodes a VGAM2236 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2236 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2236 precursor RNA is designated SEQ ID:2222, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2222 is located at position 3556 relative to the genome of Porcine Epidemic Diarrhea Virus.

[76661] VGAM2236 precursor RNA folds onto itself, forming VGAM2236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76662] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2236 folded precursor RNA into VGAM2236 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2236 RNA is designated SEQ ID:4947, and is provided hereinbelow with reference to the sequence listing part.

[76663] VGAM2236 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2236 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2236 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76664] VGAM2236 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2236 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2236 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2236 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2236 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76665] The complementary binding of VGAM2236 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2236 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2236 host target RNA into VGAM2236 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76666] It is appreciated that VGAM2236 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2236 host target genes. The mRNA of each one of this plurality of VGAM2236 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2236 RNA, herein designated VGAM RNA, and which when bound by VGAM2236 RNA causes inhibition of translation of respective one or more VGAM2236 host target proteins.

[76667] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2236 gene, herein designated VGAM GENE, on one or more VGAM2236 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76668] It is yet further appreciated that a function of VGAM2236 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM2236 correlate with, and may be deduced from, the identity of the host target genes which VGAM2236 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76669] Nucleotide sequences of the VGAM2236 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2236 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2236 are further described hereinbelow with reference to Table 1.

[76670] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2236 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2236 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76671] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2236 gene, herein designated VGAM is inhibition of expression of VGAM2236 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2236 correlate with, and may be deduced from, the identity of the target genes which VGAM2236 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76672] A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM_007203) is a VGAM2236 host target gene. AKAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKAP2, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP2 BINDING SITE, designated SEQ ID:14062, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76673] A function of VGAM2236 is therefore inhibition of A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM_007203), a gene which binds to regulatory subunit (rii) of protein kinase a. Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP2. The function of AKAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18.Autocrine Motility Factor Receptor (AMFR, Accession NM_138958) is another VGAM2236 host target gene. AMFR BINDING SITE1 and AMFR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AMFR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMFR BINDING SITE1

and AMFR BINDING SITE2, designated SEQ ID:29067 and SEQ ID:6811 respectively, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76674] Another function of VGAM2236 is therefore inhibition of Autocrine Motility Factor Receptor (AMFR, Accession NM_138958), a gene which acts to stimulate migration of fibrosarcoma cells. Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMFR. The function of AMFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM440.Diptheria Toxin Resistance Protein Required For Diphthamide Biosynthesis-like 2 (S. cerevisiae) (DPH2L2, Accession NM_001384) is another VGAM2236 host target gene. DPH2L2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DPH2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPH2L2 BINDING SITE, designated SEQ ID:7060, to the nucleotide sequence of VGAM2236 RNA,

herein designated VGAM RNA, also designated SEQ ID:4947.

[76675] Another function of VGAM2236 is therefore inhibition of Diptheria Toxin Resistance Protein Required For Diphthamide Biosynthesis-like 2 (S. cerevisiae) (DPH2L2, Accession NM_001384), a gene which is required for diphthamide biosynthesis. Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPH2L2. The function of DPH2L2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1221.Hemoglobin, Epsilon 1 (HBE1, Accession NM_005330) is another VGAM2236 host target gene. HBE1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HBE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HBE1 BINDING SITE, designated SEQ ID:11805, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76676] Another function of VGAM2236 is therefore inhibition of

Hemoglobin, Epsilon 1 (HBE1, Accession NM_005330), a gene which modulates erythrocyte metabolism and senescence, a source of physiological active catabolites. Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HBE1. The function of HBE1 has been established by previous studies. The epsilon locus determines the epsilon, or non-alpha, chain of embryonic hemoglobin (originally known as Gower-2). No mutations affecting the epsilon chain have yet been identified. Gower-1 is a tetramer of epsilon chains. The epsilon locus may be linked to the delta-beta complex. The amino acid sequence of the epsilon chain is similar to those of the delta and beta chains. Furthermore, the homologous chain in the mouse is linked to the beta locus (Gilman and Smithies, 1968). Shen and Smithies (1982) determined the complete nucleotide sequence of the 3.4-kb stretch of DNA 5-prime to the epsilon gene where a pseudogene (psi-beta-2) was thought to reside (Fritsch et al., 1980). They concluded that no globin-related gene exists there and provided a possible explanation for the earlier contrary conclusion. By studies in transgenic mice, Raich et al. (1992) demonstrated that deletion of a 'negative element'

located between -182 and -467 bp upstream of the HBE gene cap site resulted in continuation of HBE gene expression in the definitive erythroblasts of the fetal liver and in the red blood cells of adult animals. The findings provided direct in vivo evidence that cis-acting silencing elements are involved in the developmental control of the HBE gene. He and Russell (2002) analyzed the anti-sickling properties of HBE both in vitro as well as in vivo in a well-established mouse model of sickle cell anemia (OMIM Ref. No. 603903). These animals, expressing 100% of human Hb S (141900.0243), display a chronic hemolytic anemia with compensatory marrow and extramedullary erythropoiesis, abundant circulating sickled erythrocytes, and chronic tissue damage evidenced by parallel histopathologic and functional deficits. By comparison, related mice that coexpress Hb S as well as HBE exhibited normal physiologic, morphologic, histologic, and functional attributes. Subsequent in vitro analyses substantiated results from whole-animal studies, indicating that the polymerization of deoxygenated Hb S can be significantly slowed by relatively small quantities of HBE. Together, the in vivo and in vitro analyses suggested that reactivation of epsilon-globin gene expression would be

therapeutically beneficial to adults with sickle phenotypes, and provide a rationale for detailed investigations into the molecular basis for its developmental silencing.

[76677] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[76678] Shen, S.-H.; Smithies, O. : Human globin psi-beta-2 is not a globin-related sequence. Nucleic Acids Res. 10: 7809-7818, 1982. ; and

[76679] He, Z.; Russell, J. E. : A human embryonic hemoglobin inhibits Hb S polymerization in vitro and restores a normal phenotype to mouse models of sickle cell disease. Proc. Nat. Acad. Sci.

[76680] Further studies establishing the function and utilities of HBE1 are found in John Hopkins OMIM database record ID 142100, and in sited publications numbered 11689-11699 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Heat Shock 70kDa Protein 4 (HSPA4, Accession XM_114482) is another VGAM2236 host target gene. HSPA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPA4 BINDING SITE, designated SEQ ID:42975, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76681] Another function of VGAM2236 is therefore inhibition of Heat Shock 70kDa Protein 4 (HSPA4, Accession XM_114482). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPA4. V-ski Sarcoma Viral Oncogene Homolog (avian) (SKI, Accession NM_003036) is another VGAM2236 host target gene. SKI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKI BINDING SITE, designated SEQ ID:8990, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76682] Another function of VGAM2236 is therefore inhibition of V-ski Sarcoma Viral Oncogene Homolog (avian) (SKI, Accession NM_003036). Accordingly, utilities of VGAM2236

include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKI. Transmembrane Protease, Serine 2 (TMPRSS2, Accession NM_005656) is another VGAM2236 host target gene. TMPRSS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TMPRSS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMPRSS2 BINDING SITE, designated SEQ ID:12196, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76683] Another function of VGAM2236 is therefore inhibition of Transmembrane Protease, Serine 2 (TMPRSS2, Accession NM_005656). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMPRSS2. Chromosome 20 Open Reading Frame 150 (C20orf150, Accession XM_037265) is another VGAM2236 host target gene. C20orf150 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf150, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf150 BINDING SITE, designated SEQ ID:32599, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76684] Another function of VGAM2236 is therefore inhibition of Chromosome 20 Open Reading Frame 150 (C20orf150, Accession XM_037265). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf150. Cleavage Stimulation Factor, 3' Pre-RNA, Subunit 1, 50kDa (CSTF1, Accession NM_001324) is another VGAM2236 host target gene. CSTF1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CSTF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSTF1 BINDING SITE, designated SEQ ID:7009, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76685] Another function of VGAM2236 is therefore inhibition of

Cleavage Stimulation Factor, 3' Pre-RNA, Subunit 1, 50kDa (CSTF1, Accession NM_001324). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSTF1. FLJ12700 (Accession NM_024910) is another VGAM2236 host target gene. FLJ12700 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12700 BINDING SITE, designated SEQ ID:24414, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76686] Another function of VGAM2236 is therefore inhibition of FLJ12700 (Accession NM_024910). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12700. FLJ20320 (Accession NM_017765) is another VGAM2236 host target gene. FLJ20320 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20320 BINDING SITE, designated SEQ ID:19383, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76687] Another function of VGAM2236 is therefore inhibition of FLJ20320 (Accession NM_017765). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20320. Glycoprotein V (platelet) (GP5, Accession NM_004488) is another VGAM2236 host target gene. GP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GP5 BINDING SITE, designated SEQ ID:10821, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76688] Another function of VGAM2236 is therefore inhibition of Glycoprotein V (platelet) (GP5, Accession NM_004488). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with GP5. KIAA0649 (Accession NM_014811) is another VGAM2236 host target gene. KIAA0649 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0649 BINDING SITE, designated SEQ ID:16773, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76689] Another function of VGAM2236 is therefore inhibition of KIAA0649 (Accession NM_014811). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0649. KIAA1383 (Accession XM_045859) is another VGAM2236 host target gene. KIAA1383 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1383, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1383 BINDING SITE, designated SEQ ID:34585, to the

nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76690] Another function of VGAM2236 is therefore inhibition of KIAA1383 (Accession XM_045859). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1383. PA26 (Accession NM_014454) is another VGAM2236 host target gene. PA26 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PA26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PA26 BINDING SITE, designated SEQ ID:15808, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76691] Another function of VGAM2236 is therefore inhibition of PA26 (Accession NM_014454). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PA26. Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM_021815) is another VGAM2236 host target gene. SLC5A7 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by SLC5A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC5A7 BINDING SITE, designated SEQ ID:22394, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76692] Another function of VGAM2236 is therefore inhibition of Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM_021815). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC5A7. LOC118987 (Accession XM_058361) is another VGAM2236 host target gene. LOC118987 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC118987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118987 BINDING SITE, designated SEQ ID:36609, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76693] Another function of VGAM2236 is therefore inhibition of LOC118987 (Accession XM_058361). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118987. LOC150245 (Accession XM_097843) is another VGAM2236 host target gene. LOC150245 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150245 BINDING SITE, designated SEQ ID:41164, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76694] Another function of VGAM2236 is therefore inhibition of LOC150245 (Accession XM_097843). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150245. LOC151162 (Accession XM_098012) is another VGAM2236 host target gene. LOC151162 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151162, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151162 BINDING SITE, designated SEQ ID:41309, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76695] Another function of VGAM2236 is therefore inhibition of LOC151162 (Accession XM_098012). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151162. LOC158056 (Accession XM_088463) is another VGAM2236 host target gene. LOC158056 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158056 BINDING SITE, designated SEQ ID:39719, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76696] Another function of VGAM2236 is therefore inhibition of LOC158056 (Accession XM_088463). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158056. LOC202134 (Accession XM_117365) is another VGAM2236 host target gene. LOC202134 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202134 BINDING SITE, designated SEQ ID:43414, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76697] Another function of VGAM2236 is therefore inhibition of LOC202134 (Accession XM_117365). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202134. LOC203377 (Accession XM_117540) is another VGAM2236 host target gene. LOC203377 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203377, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203377 BINDING SITE, designated SEQ ID:43544, to the nucleotide sequence of VGAM2236 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4947.

[76698] Another function of VGAM2236 is therefore inhibition of LOC203377 (Accession XM_117540). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203377. LOC220988 (Accession XM_165561) is another VGAM2236 host target gene. LOC220988 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220988 BINDING SITE, designated SEQ ID:43683, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76699] Another function of VGAM2236 is therefore inhibition of LOC220988 (Accession XM_165561). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220988. LOC221271 (Accession XM_166307) is another VGAM2236 host target gene. LOC221271 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221271, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221271 BINDING SITE, designated SEQ ID:44123, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76700] Another function of VGAM2236 is therefore inhibition of LOC221271 (Accession XM_166307). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221271. LOC92370 (Accession XM_044665) is another VGAM2236 host target gene. LOC92370 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92370, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92370 BINDING SITE, designated SEQ ID:34259, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76701] Another function of VGAM2236 is therefore inhibition of LOC92370 (Accession XM_044665). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC92370. LOC93048 (Accession XM_048903) is another VGAM2236 host target gene. LOC93048 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93048 BINDING SITE, designated SEQ ID:35296, to the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, also designated SEQ ID:4947.

[76702] Another function of VGAM2236 is therefore inhibition of LOC93048 (Accession XM_048903). Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93048. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2237 (VGAM2237) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76703] VGAM2237 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2237 was detected is described hereinabove with reference to Figs. 1-8.

[76704] VGAM2237 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2237 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76705] VGAM2237 gene encodes a VGAM2237 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2237 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2237 precursor RNA is designated SEQ ID:2223, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2223 is located at position 26770 relative to the genome of Porcine Epidemic Diarrhea Virus.

[76706] VGAM2237 precursor RNA folds onto itself, forming VGAM2237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76707] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2237 folded precursor RNA into VGAM2237 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2237 RNA is designated SEQ ID:4948, and is provided hereinbelow with reference to the sequence listing part.

[76708] VGAM2237 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2237 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2237 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76709] VGAM2237 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2237 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2237 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2237 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2237 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76710] The complementary binding of VGAM2237 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2237 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2237 host target RNA into VGAM2237 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76711] It is appreciated that VGAM2237 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2237 host target genes. The mRNA of each one of this plurality of VGAM2237 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2237 RNA, herein designated VGAM RNA, and which when bound by VGAM2237 RNA causes inhibition of translation of respective one or more VGAM2237 host target proteins.

[76712] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2237 gene, herein designated VGAM GENE, on one or more VGAM2237 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76713] It is yet further appreciated that a function of VGAM2237 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM2237 correlate with, and may be deduced from, the identity of the host target genes which VGAM2237 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76714] Nucleotide sequences of the VGAM2237 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2237 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2237 are further described hereinbelow with reference to Table 1.

[76715] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2237 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2237 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76716] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2237 gene, herein designated VGAM is inhibition of expression of VGAM2237 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2237 correlate with, and may be deduced from, the identity of the target genes which VGAM2237 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76717] Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 3 (CBFA2T3, Accession NM_005187) is a VGAM2237 host target gene. CBFA2T3 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CBFA2T3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T3 BINDING SITE, designated SEQ ID:11689, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76718] A function of VGAM2237 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 3 (CBFA2T3, Accession NM_005187). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T3. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide, Y Chromosome (DBY, Accession NM_004660) is another VGAM2237 host target gene. DBY BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DBY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBY BINDING SITE, designated SEQ ID:11025, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA,

also designated SEQ ID:4948.

[76719] Another function of VGAM2237 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide, Y Chromosome (DBY, Accession NM_004660), a gene which plays a key role in the spermatogenic process. Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBY. The function of DBY and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM374.Deafness, Autosomal Dominant 5 (DFNA5, Accession NM_004403) is another VGAM2237 host target gene. DFNA5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DFNA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFNA5 BINDING SITE, designated SEQ ID:10654, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76720] Another function of VGAM2237 is therefore inhibition of Deafness, Autosomal Dominant 5 (DFNA5, Accession

NM_004403). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFNA5. Histamine N-methyltransferase (HNMT, Accession NM_006895) is another VGAM2237 host target gene. HNMT BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNMT BINDING SITE, designated SEQ ID:13767, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76721] Another function of VGAM2237 is therefore inhibition of Histamine N-methyltransferase (HNMT, Accession NM_006895), a gene which inactivates histamine by n-methylation. Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNMT. The function of HNMT has been established by previous studies. Preuss et al. (1998) demonstrated a common 314C-T polymorphism in the HNMT gene resulting in a thr105-to-ile amino acid substitution (605238.0001). The 314T allele is

associated with decreased levels of both HNMT enzymatic activity and immunoreactive protein; therefore, the presence of the 314T allele would be expected to result in reduced histamine metabolism and increased bronchoconstriction. Yan et al. (2000) characterized the common, functionally significant 314T polymorphism in DNA samples from 237 randomly selected Caucasian control subjects and 192 samples from Caucasian asthmatic patients. The frequency of the 314T allele of the HNMT gene was 0.08 in the control samples and 0.14 in samples from Caucasian asthmatic patients (odds ratio = 1.9, P less than 0.01), indicating a significant increase in the frequency of subjects with low HNMT activity among asthmatics.

[76722] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[76723] Preuss, C. V.; Wood, T. C.; Szumlanski, C. L.; Raftogianis, R. B.; Otterness, D. M.; Girard, B.; Scott, M. C.; Weinshilboum, R. M. : Human histamine N-methyltransferase pharmacogenetics: common genetic polymorphisms that alter activity. Molec. Pharm. 53: 708-717, 1998. ; and

[76724] Yan, L.; Galinsky, R. E.; Bernstein, J. A.; Liggett, S. B.;

Weinshilboum, R. M. : Histamine N-methyltransferase pharmacogenetics: association of a common functional polymorphism with asthma.

[76725] Further studies establishing the function and utilities of HNMT are found in John Hopkins OMIM database record ID 605238, and in sited publications numbered 7488-7493 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Junctophilin 2 (JPH2, Accession XM_170491) is another VGAM2237 host target gene. JPH2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by JPH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JPH2 BINDING SITE, designated SEQ ID:45333, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76726] Another function of VGAM2237 is therefore inhibition of Junctophilin 2 (JPH2, Accession XM_170491), a gene which mediates cross talk between cell surface and intracellular ion channels. Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with JPH2. The function of JPH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM295.Neurobeachin (NBEA, Accession XM_170732) is another VGAM2237 host target gene. NBEA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NBEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBEA BINDING SITE, designated SEQ ID:45494, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76727] Another function of VGAM2237 is therefore inhibition of Neurobeachin (NBEA, Accession XM_170732), a gene which may mediate protein-protein interactions. Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBEA. The function of NBEA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459.Translin (TSN, Accession

NM_004622) is another VGAM2237 host target gene. TSN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSN BINDING SITE, designated SEQ ID:10987, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76728] Another function of VGAM2237 is therefore inhibition of Translin (TSN, Accession NM_004622), a gene which is a DNA binding protein and involved in DNA repair, replication, or recombination. Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSN. The function of TSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM98.Vinculin (VCL, Accession NM_003373) is another VGAM2237 host target gene. VCL BINDING SITE1 and VCL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by VCL, corresponding to HOST TARGET binding sites such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VCL BINDING SITE1 and VCL BINDING SITE2, designated SEQ ID:9406 and SEQ ID:15195 respectively, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76729] Another function of VGAM2237 is therefore inhibition of Vinculin (VCL, Accession NM_003373). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VCL. CASPR3 (Accession NM_024879) is another VGAM2237 host target gene. CASPR3 BINDING SITE1 and CASPR3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASPR3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASPR3 BINDING SITE1 and CASPR3 BINDING SITE2, designated SEQ ID:24317 and SEQ ID:27388 respectively, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76730] Another function of VGAM2237 is therefore inhibition of

CASPR3 (Accession NM_024879). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASPR3. Death Associated Transcription Factor 1 (DATF1, Accession NM_022105) is another VGAM2237 host target gene. DATF1 BINDING SITE1 and DATF1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DATF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DATF1 BINDING SITE1 and DATF1 BINDING SITE2, designated SEQ ID:22652 and SEQ ID:25991 respectively, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76731] Another function of VGAM2237 is therefore inhibition of Death Associated Transcription Factor 1 (DATF1, Accession NM_022105). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DATF1. FLJ12529 (Accession NM_024811) is another VGAM2237 host target gene. FLJ12529 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by FLJ12529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12529 BINDING SITE, designated SEQ ID:24190, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76732] Another function of VGAM2237 is therefore inhibition of FLJ12529 (Accession NM_024811). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12529. KIAA0408 (Accession NM_014702) is another VGAM2237 host target gene. KIAA0408 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0408 BINDING SITE, designated SEQ ID:16228, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76733] Another function of VGAM2237 is therefore inhibition of KIAA0408 (Accession NM_014702). Accordingly, utilities

of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0408. KIAA0618 (Accession NM_014833) is another VGAM2237 host target gene. KIAA0618 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0618 BINDING SITE, designated SEQ ID:16831, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76734] Another function of VGAM2237 is therefore inhibition of KIAA0618 (Accession NM_014833). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0618. KIAA1191 (Accession NM_020444) is another VGAM2237 host target gene. KIAA1191 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1191 BINDING SITE, designated SEQ ID:21683, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76735] Another function of VGAM2237 is therefore inhibition of KIAA1191 (Accession NM_020444). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1191. KIAA1944 (Accession XM_062545) is another VGAM2237 host target gene. KIAA1944 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1944 BINDING SITE, designated SEQ ID:37232, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76736] Another function of VGAM2237 is therefore inhibition of KIAA1944 (Accession XM_062545). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1944. MGC2668 (Accession XM_026968) is another VGAM2237 host target gene. MGC2668 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2668 BINDING SITE, designated SEQ ID:30379, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76737] Another function of VGAM2237 is therefore inhibition of MGC2668 (Accession XM_026968). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2668. NIN283 (Accession NM_032268) is another VGAM2237 host target gene. NIN283 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NIN283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIN283 BINDING SITE, designated SEQ ID:26013, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76738] Another function of VGAM2237 is therefore inhibition of

NIN283 (Accession NM_032268). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIN283. TRABID (Accession XM_043669) is another VGAM2237 host target gene. TRABID BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TRABID, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRABID BINDING SITE, designated SEQ ID:33992, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76739] Another function of VGAM2237 is therefore inhibition of TRABID (Accession XM_043669). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRABID. LOC139770 (Accession XM_060053) is another VGAM2237 host target gene. LOC139770 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC139770, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC139770 BINDING SITE, designated SEQ ID:37150, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76740] Another function of VGAM2237 is therefore inhibition of LOC139770 (Accession XM_060053). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139770. LOC146268 (Accession XM_085397) is another VGAM2237 host target gene. LOC146268 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146268 BINDING SITE, designated SEQ ID:38124, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76741] Another function of VGAM2237 is therefore inhibition of LOC146268 (Accession XM_085397). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146268. LOC147136 (Accession XM_085716) is an-

other VGAM2237 host target gene. LOC147136 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147136 BINDING SITE, designated SEQ ID:38298, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76742] Another function of VGAM2237 is therefore inhibition of LOC147136 (Accession XM_085716). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147136. LOC219793 (Accession XM_166127) is another VGAM2237 host target gene. LOC219793 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219793, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219793 BINDING SITE, designated SEQ ID:43915, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76743] Another function of VGAM2237 is therefore inhibition of LOC219793 (Accession XM_166127). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219793. LOC219920 (Accession XM_167787) is another VGAM2237 host target gene. LOC219920 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219920 BINDING SITE, designated SEQ ID:44812, to the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, also designated SEQ ID:4948.

[76744] Another function of VGAM2237 is therefore inhibition of LOC219920 (Accession XM_167787). Accordingly, utilities of VGAM2237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219920. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2238 (VGAM2238) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[76745] VGAM2238 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2238 was detected is described hereinabove with reference to Figs. 1-8.

[76746] VGAM2238 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2238 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76747] VGAM2238 gene encodes a VGAM2238 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2238 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2238 precursor RNA is designated SEQ ID:2224, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2224 is located at position 7462 relative to the genome of Porcine Epidemic Diarrhea Virus.

[76748] VGAM2238 precursor RNA folds onto itself, forming VGAM2238 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76749] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2238 folded precursor RNA into VGAM2238 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2238 RNA is designated SEQ ID:4949, and is provided hereinbelow with reference to the sequence listing part.

[76750] VGAM2238 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2238 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2238 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76751] VGAM2238 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2238 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2238 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2238 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2238 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76752] The complementary binding of VGAM2238 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2238 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2238 host target RNA into VGAM2238 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76753] It is appreciated that VGAM2238 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2238 host target genes. The mRNA of each one of this plurality of VGAM2238 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2238 RNA, herein designated VGAM RNA, and which when bound by VGAM2238 RNA causes inhibition of translation of respective one or more VGAM2238 host target proteins.

[76754] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2238 gene, herein designated VGAM GENE, on one or more VGAM2238 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76755] It is yet further appreciated that a function of VGAM2238 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM2238 correlate with, and may be deduced from, the identity of the host target genes which VGAM2238 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[76756] Nucleotide sequences of the VGAM2238 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2238 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2238 are further described hereinbelow with reference to Table 1.

[76757] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2238 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2238 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76758] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2238 gene, herein designated VGAM is inhibition of expression of VGAM2238 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2238 correlate with, and may be deduced from, the identity of the target genes which VGAM2238 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76759] Adenylate Cyclase 7 (ADCY7, Accession NM_001114) is a VGAM2238 host target gene. ADCY7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADCY7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY7 BINDING SITE, designated SEQ ID:6784, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76760] A function of VGAM2238 is therefore inhibition of Adenylate Cyclase 7 (ADCY7, Accession NM_001114), a gene which this a membrane-bound, ca(2+)-inhibitable adenylyl cyclase. Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY7. The function of ADCY7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM108.ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916) is another VGAM2238 host target gene. ATP8A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by ATP8A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8A2 BINDING SITE, designated SEQ ID:44921, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76761] Another function of VGAM2238 is therefore inhibition of ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8A2. B-cell CLL/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NM_001706) is another VGAM2238 host target gene. BCL6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BCL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL6 BINDING SITE, designated SEQ ID:7431, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76762] Another function of VGAM2238 is therefore inhibition of B-cell CLL/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NM_001706), a gene which is involved in the generation and maintenance of both T and B cells during immune responses. Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL6. The function of BCL6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481.Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 4 (MLLT4, Accession XM_051832) is another VGAM2238 host target gene. MLLT4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MLLT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT4 BINDING SITE, designated SEQ ID:35887, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76763] Another function of VGAM2238 is therefore inhibition of

Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 4 (MLLT4, Accession XM_051832), a gene which may act as an intracellular signaling component. Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT4. The function of MLLT4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1608.Proteasome (prosome, macropain) Activator Subunit 3 (PA28 gamma; Ki) (PSME3, Accession NM_005789) is another VGAM2238 host target gene. PSME3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PSME3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSME3 BINDING SITE, designated SEQ ID:12371, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76764] Another function of VGAM2238 is therefore inhibition of Proteasome (prosome, macropain) Activator Subunit 3

(PA28 gamma; Ki) (PSME3, Accession NM_005789), a gene which is the activator subunit of the proteasome (prosome macropain). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSME3. The function of PSME3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1498.RAB23, Member RAS Oncogene Family (RAB23, Accession NM_016277) is another VGAM2238 host target gene. RAB23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB23 BINDING SITE, designated SEQ ID:18400, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76765] Another function of VGAM2238 is therefore inhibition of RAB23, Member RAS Oncogene Family (RAB23, Accession NM_016277), a gene which is involved in the regulation of intracellular membrane trafficking. Accordingly, utilities of

VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB23. The function of RAB23 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340.Solute Carrier Family 1 (neuronal/epithelial high affinity glutamate transporter, system Xag), Member 1 (SLC1A1, Accession NM_004170) is another VGAM2238 host target gene. SLC1A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A1 BINDING SITE, designated SEQ ID:10377, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76766] Another function of VGAM2238 is therefore inhibition of Solute Carrier Family 1 (neuronal/epithelial high affinity glutamate transporter, system Xag), Member 1 (SLC1A1, Accession NM_004170), a gene which is a glutamate transporter, essential for terminating the postsynaptic action of glutamate by rapidly removing it from the synaptic

cleft. Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A1. The function of SLC1A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.ATPase, Class II, Type 9A (ATP9A, Accession XM_030577) is another VGAM2238 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:31085, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76767] Another function of VGAM2238 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM_030577). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM_002384) is another VGAM2238 host target gene. DGKD BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by DGKD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKD BINDING SITE, designated SEQ ID:29883, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76768] Another function of VGAM2238 is therefore inhibition of Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM_002384). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKD. FLJ10520 (Accession NM_018124) is another VGAM2238 host target gene. FLJ10520 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10520 BINDING SITE, designated SEQ ID:19905, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76769] Another function of VGAM2238 is therefore inhibition of FLJ10520 (Accession NM_018124). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10520. FLJ20618 (Accession NM_017903) is another VGAM2238 host target gene. FLJ20618 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20618 BINDING SITE, designated SEQ ID:19569, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76770] Another function of VGAM2238 is therefore inhibition of FLJ20618 (Accession NM_017903). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20618. Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM_133445) is another VGAM2238 host target gene. GRIN3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRIN3A, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN3A BINDING SITE, designated SEQ ID:28536, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76771] Another function of VGAM2238 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM_133445). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN3A. H2A Histone Family, Member J (H2AFJ, Accession NM_018267) is another VGAM2238 host target gene. H2AFJ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H2AFJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AFJ BINDING SITE, designated SEQ ID:20237, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76772] Another function of VGAM2238 is therefore inhibition of

H2A Histone Family, Member J (H2AFJ, Accession NM_018267). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AFJ. KIAA0565 (Accession XM_039912) is another VGAM2238 host target gene. KIAA0565 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0565 BINDING SITE, designated SEQ ID:33216, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76773] Another function of VGAM2238 is therefore inhibition of KIAA0565 (Accession XM_039912). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0565. KIAA0677 (Accession NM_014663) is another VGAM2238 host target gene. KIAA0677 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0677, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0677 BINDING SITE, designated SEQ ID:16110, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76774] Another function of VGAM2238 is therefore inhibition of KIAA0677 (Accession NM_014663). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0677. KIAA0794 (Accession XM_087353) is another VGAM2238 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:39177, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76775] Another function of VGAM2238 is therefore inhibition of KIAA0794 (Accession XM_087353). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0794. KIAA0979 (Accession NM_015032) is another VGAM2238 host target gene. KIAA0979 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0979 BINDING SITE, designated SEQ ID:17387, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76776] Another function of VGAM2238 is therefore inhibition of KIAA0979 (Accession NM_015032). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0979. Lipoma HMGIC Fusion Partner (LHFP, Accession NM_005780) is another VGAM2238 host target gene. LHFP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LHFP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHFP BINDING SITE, designated SEQ ID:12356, to the nucleotide sequence of VGAM2238 RNA, herein designated

VGAM RNA, also designated SEQ ID:4949.

[76777] Another function of VGAM2238 is therefore inhibition of Lipoma HMGIC Fusion Partner (LHFP, Accession NM_005780). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHFP. MKP-7 (Accession XM_039106) is another VGAM2238 host target gene. MKP-7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MKP-7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKP-7 BINDING SITE, designated SEQ ID:33007, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76778] Another function of VGAM2238 is therefore inhibition of MKP-7 (Accession XM_039106). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKP-7. PORIMIN (Accession NM_052932) is another VGAM2238 host target gene. PORIMIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by PORIMIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PORIMIN BINDING SITE, designated SEQ ID:27491, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76779] Another function of VGAM2238 is therefore inhibition of PORIMIN (Accession NM_052932). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PORIMIN. Protein Tyrosine Kinase 9 (PTK9, Accession NM_002822) is another VGAM2238 host target gene. PTK9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTK9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK9 BINDING SITE, designated SEQ ID:8691, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76780] Another function of VGAM2238 is therefore inhibition of Protein Tyrosine Kinase 9 (PTK9, Accession NM_002822).

Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK9. Syntaphilin (SNPH, Accession NM_014723) is another VGAM2238 host target gene. SNPH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE, designated SEQ ID:16295, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76781] Another function of VGAM2238 is therefore inhibition of Syntaphilin (SNPH, Accession NM_014723). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. LOC115509 (Accession XM_056092) is another VGAM2238 host target gene. LOC115509 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC115509 BINDING SITE, designated SEQ ID:36364, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76782] Another function of VGAM2238 is therefore inhibition of LOC115509 (Accession XM_056092). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115509. LOC134266 (Accession XM_059701) is another VGAM2238 host target gene. LOC134266 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC134266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134266 BINDING SITE, designated SEQ ID:37068, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76783] Another function of VGAM2238 is therefore inhibition of LOC134266 (Accession XM_059701). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134266. LOC145439 (Accession XM_085144) is another VGAM2238 host target gene. LOC145439 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145439, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145439 BINDING SITE, designated SEQ ID:37865, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76784] Another function of VGAM2238 is therefore inhibition of LOC145439 (Accession XM_085144). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145439. LOC146819 (Accession XM_085605) is another VGAM2238 host target gene. LOC146819 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146819 BINDING SITE, designated SEQ ID:38254, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76785] Another function of VGAM2238 is therefore inhibition of

LOC146819 (Accession XM_085605). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146819. LOC146821 (Accession XM_085597) is another VGAM2238 host target gene. LOC146821 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146821, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146821 BINDING SITE, designated SEQ ID:38252, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76786] Another function of VGAM2238 is therefore inhibition of LOC146821 (Accession XM_085597). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146821. LOC150142 (Accession XM_086791) is another VGAM2238 host target gene. LOC150142 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC150142 BINDING SITE, designated SEQ ID:38853, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76787] Another function of VGAM2238 is therefore inhibition of LOC150142 (Accession XM_086791). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150142. LOC201287 (Accession XM_113947) is another VGAM2238 host target gene. LOC201287 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201287 BINDING SITE, designated SEQ ID:42559, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76788] Another function of VGAM2238 is therefore inhibition of LOC201287 (Accession XM_113947). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201287. LOC219627 (Accession XM_166402) is an-

other VGAM2238 host target gene. LOC219627 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219627 BINDING SITE, designated SEQ ID:44271, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76789] Another function of VGAM2238 is therefore inhibition of LOC219627 (Accession XM_166402). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219627. LOC220705 (Accession XM_166000) is another VGAM2238 host target gene. LOC220705 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220705 BINDING SITE, designated SEQ ID:43834, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76790] Another function of VGAM2238 is therefore inhibition of LOC220705 (Accession XM_166000). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220705. LOC221895 (Accession XM_166511) is another VGAM2238 host target gene. LOC221895 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221895 BINDING SITE, designated SEQ ID:44442, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76791] Another function of VGAM2238 is therefore inhibition of LOC221895 (Accession XM_166511). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221895. LOC222060 (Accession XM_168427) is another VGAM2238 host target gene. LOC222060 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222060, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222060 BINDING SITE, designated SEQ ID:45160, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76792] Another function of VGAM2238 is therefore inhibition of LOC222060 (Accession XM_168427). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222060. LOC256207 (Accession XM_170837) is another VGAM2238 host target gene. LOC256207 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256207 BINDING SITE, designated SEQ ID:45617, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76793] Another function of VGAM2238 is therefore inhibition of LOC256207 (Accession XM_170837). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC256207. LOC86651 (Accession XM_044052) is another VGAM2238 host target gene. LOC86651 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC86651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC86651 BINDING SITE, designated SEQ ID:34098, to the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, also designated SEQ ID:4949.

[76794] Another function of VGAM2238 is therefore inhibition of LOC86651 (Accession XM_044052). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC86651. LOC91151 (Accession NM_033208) is another VGAM2238 host target gene. LOC91151 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91151, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91151 BINDING SITE, designated SEQ ID:27053, to the nucleotide sequence of VGAM2238 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4949.

[76795] Another function of VGAM2238 is therefore inhibition of LOC91151 (Accession NM_033208). Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91151. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2239 (VGAM2239) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76796] VGAM2239 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2239 was detected is described hereinabove with reference to Figs. 1-8.

[76797] VGAM2239 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2239 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76798] VGAM2239 gene encodes a VGAM2239 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2239 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2239 precursor RNA is designated SEQ ID:2225, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2225 is located at position 11663 relative to the genome of Porcine Epidemic Diarrhea Virus.

[76799] VGAM2239 precursor RNA folds onto itself, forming VGAM2239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76800] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2239 folded precursor RNA into VGAM2239 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM2239 RNA is designated SEQ ID:4950, and is provided hereinbelow with reference to the sequence listing part.

[76801] VGAM2239 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2239 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2239 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76802] VGAM2239 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2239 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2239 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2239 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2239 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76803] The complementary binding of VGAM2239 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2239 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2239 host target RNA into VGAM2239 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76804] It is appreciated that VGAM2239 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2239 host target genes. The mRNA of

each one of this plurality of VGAM2239 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2239 RNA, herein designated VGAM RNA, and which when bound by VGAM2239 RNA causes inhibition of translation of respective one or more VGAM2239 host target proteins.

[76805] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2239 gene, herein designated VGAM GENE, on one or more VGAM2239 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[76806] It is yet further appreciated that a function of VGAM2239 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM2239 correlate with, and may be deduced from, the identity of the host target genes which VGAM2239 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76807] Nucleotide sequences of the VGAM2239 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2239 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2239 are further described hereinbelow with reference to Table 1.

[76808] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2239 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2239 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76809] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2239 gene, herein designated VGAM is inhibition of expression of VGAM2239 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2239 correlate with, and may be deduced from, the identity of the target genes which VGAM2239 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76810] ATP-binding Cassette, Sub-family A (ABC1), Member 1 (ABCA1, Accession NM_005502) is a VGAM2239 host target gene. ABCA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA1 BINDING SITE, designated SEQ ID:12015, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76811] A function of VGAM2239 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 1 (ABCA1,

Accession NM_005502), a gene which camp-dependent and sulfonylurea-sensitive anion transporter. Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA1. The function of ABCA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1956.Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147) is another VGAM2239 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42719, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76812] Another function of VGAM2239 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM2239 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with EIF1A. The function of EIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.Protocadherin 12 (PCDH12, Accession NM_016580) is another VGAM2239 host target gene. PCDH12 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCDH12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH12 BINDING SITE, designated SEQ ID:18658, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76813] Another function of VGAM2239 is therefore inhibition of Protocadherin 12 (PCDH12, Accession NM_016580), a gene which is a member of a family of nonclassical cadherins. Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH12. The function of PCDH12 has been established by previous studies. Murine vascular endothelial cadherin-2 is a cellular adhesion

molecule that is distinct from vascular endothelial cadherin-1 (CDH5; 601120) in that it does not interact with catenins and does not appear to affect cell migration or growth (Telo et al., 1998). By sequence database searching, Wu and Maniatis (2000) identified a human VE-cadherin-2 homolog, which they called protocadherin-12 (OMIM Ref. No. PCDH12), encoding a deduced 1,184-amino acid protein that shares 81% sequence identity with the mouse protein. PCDH12 contains 4 exons; a single large exon encodes the extracellular and transmembrane domains, and 3 small exons encode the cytoplasmic domain. Wu and Maniatis (2000) concluded that the presence of unusually large exons is a characteristic feature of protocadherin. Using the mouse Pcdh12 cDNA sequence and RACE-PCR reactions, Ludwig et al. (2000) cloned a full-length PCDH12 cDNA from a human fetal kidney cDNA library. Northern blot analysis detected expression of a 5-kb PCHD12 transcript chiefly in highly vascularized tissues including the heart and placenta, but most tissues contained a low level of expression. Prominent expression was also detected in the spleen. Some tissues, including skeletal muscle and peripheral blood leukocytes, possessed transcripts of a larger size.

[76814] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[76815] Wu, Q.; Maniatis, T. : Large exons encoding multiple ectodomains are a characteristic feature of protocadherin genes. Proc. Nat. Acad. Sci. 97: 3124-3129, 2000. ; and

[76816] Ludwig, D.; Lorenz, J.; Dejana, E.; Bohlen, P.; Hicklin, D. J.; Witte, L.; Pytowski, B. : cDNA cloning, chromosomal mapping, and expression analysis of human VE-cadherin-2. Mammalian Ge.

[76817] Further studies establishing the function and utilities of PCDH12 are found in John Hopkins OMIM database record ID 605622, and in sited publications numbered 6956-695 and 7438 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Ribonucleotide Reductase M2 B (TP53 inducible) (RRM2B, Accession XM_042096) is another VGAM2239 host target gene. RRM2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RRM2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRM2B BINDING SITE, des-

ignated SEQ ID:33689, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76818] Another function of VGAM2239 is therefore inhibition of Ribonucleotide Reductase M2 B (TP53 inducible) (RRM2B, Accession XM_042096). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRM2B. V-akt Murine Thymoma Viral Oncogene Homolog 3 (protein kinase B, gamma) (AKT3, Accession NM_005465) is another VGAM2239 host target gene. AKT3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKT3 BINDING SITE, designated SEQ ID:11957, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76819] Another function of VGAM2239 is therefore inhibition of V-akt Murine Thymoma Viral Oncogene Homolog 3 (protein kinase B, gamma) (AKT3, Accession NM_005465). Accordingly, utilities of VGAM2239 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with AKT3. DnaJ (Hsp40) Homolog, Subfamily C, Member 6 (DNAJC6, Accession NM_014787) is another VGAM2239 host target gene. DNAJC6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNAJC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJC6 BINDING SITE, designated SEQ ID:16661, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76820] Another function of VGAM2239 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily C, Member 6 (DNAJC6, Accession NM_014787). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC6. KIAA0694 (Accession XM_051970) is another VGAM2239 host target gene. KIAA0694 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0694 BINDING SITE, designated SEQ ID:35928, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76821] Another function of VGAM2239 is therefore inhibition of KIAA0694 (Accession XM_051970). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0694. KIAA0892 (Accession XM_048457) is another VGAM2239 host target gene. KIAA0892 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0892 BINDING SITE, designated SEQ ID:35169, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76822] Another function of VGAM2239 is therefore inhibition of KIAA0892 (Accession XM_048457). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0892. Low Density Lipoprotein-related Protein 1B

(deleted in tumors) (LRP1B, Accession NM_018557) is another VGAM2239 host target gene. LRP1B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LRP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP1B BINDING SITE, designated SEQ ID:20639, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76823] Another function of VGAM2239 is therefore inhibition of Low Density Lipoprotein-related Protein 1B (deleted in tumors) (LRP1B, Accession NM_018557). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP1B. Nuclear Receptor Subfamily 6, Group A, Member 1 (NR6A1, Accession NM_033334) is another VGAM2239 host target gene. NR6A1 BINDING SITE1 through NR6A1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NR6A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of NR6A1 BINDING SITE1 through NR6A1 BINDING SITE3, designated SEQ ID:27181, SEQ ID:27187 and SEQ ID:7233 respectively, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76824] Another function of VGAM2239 is therefore inhibition of Nuclear Receptor Subfamily 6, Group A, Member 1 (NR6A1, Accession NM_033334). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR6A1. LOC147632 (Accession NM_138478) is another VGAM2239 host target gene. LOC147632 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147632 BINDING SITE, designated SEQ ID:28826, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76825] Another function of VGAM2239 is therefore inhibition of LOC147632 (Accession NM_138478). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC147632. LOC148894 (Accession XM_097542) is another VGAM2239 host target gene. LOC148894 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148894 BINDING SITE, designated SEQ ID:40919, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76826] Another function of VGAM2239 is therefore inhibition of LOC148894 (Accession XM_097542). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148894. LOC151473 (Accession XM_087215) is another VGAM2239 host target gene. LOC151473 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151473 BINDING SITE, designated SEQ ID:39120, to

the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76827] Another function of VGAM2239 is therefore inhibition of LOC151473 (Accession XM_087215). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151473. LOC151521 (Accession XM_098076) is another VGAM2239 host target gene. LOC151521 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151521, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151521 BINDING SITE, designated SEQ ID:41370, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76828] Another function of VGAM2239 is therefore inhibition of LOC151521 (Accession XM_098076). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151521. LOC157349 (Accession XM_088298) is another VGAM2239 host target gene. LOC157349 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC157349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE, designated SEQ ID:39594, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76829] Another function of VGAM2239 is therefore inhibition of LOC157349 (Accession XM_088298). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349. LOC200150 (Accession XM_114131) is another VGAM2239 host target gene. LOC200150 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200150 BINDING SITE, designated SEQ ID:42713, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76830] Another function of VGAM2239 is therefore inhibition of LOC200150 (Accession XM_114131). Accordingly, utilities

of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200150. LOC51185 (Accession NM_016302) is another VGAM2239 host target gene. LOC51185 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51185 BINDING SITE, designated SEQ ID:18424, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76831] Another function of VGAM2239 is therefore inhibition of LOC51185 (Accession NM_016302). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51185. LOC56906 (Accession NM_020147) is another VGAM2239 host target gene. LOC56906 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC56906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC56906 BINDING SITE, designated SEQ ID:21343, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76832] Another function of VGAM2239 is therefore inhibition of LOC56906 (Accession NM_020147). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56906. LOC92539 (Accession XM_045632) is another VGAM2239 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92539 BINDING SITE, designated SEQ ID:34500, to the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, also designated SEQ ID:4950.

[76833] Another function of VGAM2239 is therefore inhibition of LOC92539 (Accession XM_045632). Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2240 (VGAM2240) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76834] VGAM2240 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2240 was detected is described hereinabove with reference to Figs. 1-8.

[76835] VGAM2240 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2240 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76836] VGAM2240 gene encodes a VGAM2240 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2240 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2240 precursor RNA is designated SEQ ID:2226, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2226 is located at position 27326 relative to the

genome of Porcine Epidemic Diarrhea Virus.

[76837] VGAM2240 precursor RNA folds onto itself, forming VGAM2240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76838] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2240 folded precursor RNA into VGAM2240 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2240 RNA is designated SEQ ID:4951, and is provided hereinbelow with reference to the sequence listing part.

[76839] VGAM2240 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2240 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2240 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76840] VGAM2240 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2240 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2240 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2240 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2240 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76841] The complementary binding of VGAM2240 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2240 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2240 host target RNA into VGAM2240 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76842] It is appreciated that VGAM2240 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2240 host target genes. The mRNA of each one of this plurality of VGAM2240 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2240 RNA, herein designated VGAM RNA, and which when bound by VGAM2240 RNA causes inhibition of translation of respective one or more VGAM2240 host target proteins.

[76843] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2240 gene, herein designated VGAM GENE, on one or more VGAM2240 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76844] It is yet further appreciated that a function of VGAM2240 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2240 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of

VGAM2240 correlate with, and may be deduced from, the identity of the host target genes which VGAM2240 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76845] Nucleotide sequences of the VGAM2240 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2240 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2240 are further described hereinbelow with reference to Table 1.

[76846] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2240 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2240 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76847] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2240 gene, herein designated VGAM is inhibition of expression of VGAM2240 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2240 correlate with, and may be deduced

from, the identity of the target genes which VGAM2240 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76848] Solute Carrier Family 39 (zinc transporter), Member 1 (SLC39A1, Accession NM_014437) is a VGAM2240 host target gene. SLC39A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC39A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC39A1 BINDING SITE, designated SEQ ID:15794, to the nucleotide sequence of VGAM2240 RNA, herein designated VGAM RNA, also designated SEQ ID:4951.

[76849] A function of VGAM2240 is therefore inhibition of Solute Carrier Family 39 (zinc transporter), Member 1 (SLC39A1, Accession NM_014437), a gene which is a divalent (zinc/iron) metal ion transporter. Accordingly, utilities of VGAM2240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC39A1. The function of SLC39A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM1049.SRY (sex determining region Y)-box 12 (SOX12, Accession NM_006943) is another VGAM2240 host target gene. SOX12 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SOX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX12 BINDING SITE, designated SEQ ID:13828, to the nucleotide sequence of VGAM2240 RNA, herein designated VGAM RNA, also designated SEQ ID:4951.

[76850] Another function of VGAM2240 is therefore inhibition of SRY (sex determining region Y)-box 12 (SOX12, Accession NM_006943). Accordingly, utilities of VGAM2240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX12. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737) is another VGAM2240 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of RASSF2 BINDING SITE, designated SEQ ID:16391, to the nucleotide sequence of VGAM2240 RNA, herein designated VGAM RNA, also designated SEQ ID:4951.

[76851] Another function of VGAM2240 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737). Accordingly, utilities of VGAM2240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM_007107) is another VGAM2240 host target gene. SSR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR3 BINDING SITE, designated SEQ ID:13973, to the nucleotide sequence of VGAM2240 RNA, herein designated VGAM RNA, also designated SEQ ID:4951.

[76852] Another function of VGAM2240 is therefore inhibition of Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM_007107). Accord-

ingly, utilities of VGAM2240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSR3. LOC152200 (Accession XM_098174) is another VGAM2240 host target gene. LOC152200 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152200 BINDING SITE, designated SEQ ID:41436, to the nucleotide sequence of VGAM2240 RNA, herein designated VGAM RNA, also designated SEQ ID:4951.

[76853] Another function of VGAM2240 is therefore inhibition of LOC152200 (Accession XM_098174). Accordingly, utilities of VGAM2240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152200. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2241 (VGAM2241) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76854] VGAM2241 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2241 was detected is described hereinabove with reference to Figs. 1-8.

[76855] VGAM2241 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2241 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76856] VGAM2241 gene encodes a VGAM2241 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2241 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2241 precursor RNA is designated SEQ ID:2227, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2227 is located at position 14383 relative to the genome of Porcine Epidemic Diarrhea Virus.

[76857] VGAM2241 precursor RNA folds onto itself, forming VGAM2241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76858] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2241 folded precursor RNA into VGAM2241 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2241 RNA is designated SEQ ID:4952, and is provided hereinbelow with reference to the sequence listing part.

[76859] VGAM2241 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2241 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2241 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[76860] VGAM2241 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2241 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2241 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2241 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2241 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76861] The complementary binding of VGAM2241 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2241 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2241 host target RNA into VGAM2241 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76862] It is appreciated that VGAM2241 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2241 host target genes. The mRNA of each one of this plurality of VGAM2241 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2241 RNA, herein designated VGAM RNA, and which when bound by VGAM2241 RNA causes inhibition of translation of respective one or more VGAM2241 host target proteins.

[76863] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2241 gene, herein designated VGAM GENE, on one or more VGAM2241 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76864] It is yet further appreciated that a function of VGAM2241 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2241 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM2241 correlate with, and may be deduced from, the identity of the host target genes which VGAM2241 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76865] Nucleotide sequences of the VGAM2241 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2241 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2241 are further described hereinbelow with reference to Table 1.

[76866] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2241 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2241 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76867] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2241 gene, herein designated VGAM is inhibition of expression of VGAM2241 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2241 correlate with, and may be deduced from, the identity of the target genes which VGAM2241 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76868] POPX1 (Accession NM_014906) is a VGAM2241 host target gene. POPX1 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by POPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POPX1 BINDING SITE, designated SEQ ID:17117, to the nucleotide sequence of VGAM2241 RNA, herein designated VGAM RNA, also designated SEQ ID:4952.

[76869] A function of VGAM2241 is therefore inhibition of POPX1 (Accession NM_014906). Accordingly, utilities of VGAM2241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POPX1. PRO2714 (Accession NM_018534) is another VGAM2241 host target gene. PRO2714 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2714 BINDING SITE, designated SEQ ID:20603, to the nucleotide sequence of VGAM2241 RNA, herein designated VGAM RNA, also designated SEQ ID:4952.

[76870] Another function of VGAM2241 is therefore inhibition of

PRO2714 (Accession NM_018534). Accordingly, utilities of VGAM2241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2714. Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM_000617) is another VGAM2241 host target gene. SLC11A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC11A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC11A2 BINDING SITE, designated SEQ ID:6223, to the nucleotide sequence of VGAM2241 RNA, herein designated VGAM RNA, also designated SEQ ID:4952.

[76871] Another function of VGAM2241 is therefore inhibition of Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM_000617). Accordingly, utilities of VGAM2241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A2. LOC254228 (Accession XM_171123) is another VGAM2241 host target gene. LOC254228 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by LOC254228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254228 BINDING SITE, designated SEQ ID:45918, to the nucleotide sequence of VGAM2241 RNA, herein designated VGAM RNA, also designated SEQ ID:4952.

[76872] Another function of VGAM2241 is therefore inhibition of LOC254228 (Accession XM_171123). Accordingly, utilities of VGAM2241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254228. LOC90736 (Accession XM_033811) is another VGAM2241 host target gene. LOC90736 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90736, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90736 BINDING SITE, designated SEQ ID:31959, to the nucleotide sequence of VGAM2241 RNA, herein designated VGAM RNA, also designated SEQ ID:4952.

[76873] Another function of VGAM2241 is therefore inhibition of

LOC90736 (Accession XM_033811). Accordingly, utilities of VGAM2241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90736. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2242 (VGAM2242) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76874] VGAM2242 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2242 was detected is described hereinabove with reference to Figs. 1-8.

[76875] VGAM2242 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2242 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76876] VGAM2242 gene encodes a VGAM2242 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2242 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2242 precursor RNA is designated SEQ ID:2228, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2228 is located at position 2414 relative to the genome of Porcine Epidemic Diarrhea Virus.

[76877] VGAM2242 precursor RNA folds onto itself, forming VGAM2242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76878] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2242 folded precursor RNA into VGAM2242 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide se-

quence of VGAM2242 RNA is designated SEQ ID:4953, and is provided hereinbelow with reference to the sequence listing part.

[76879] VGAM2242 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2242 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2242 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76880] VGAM2242 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2242 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2242 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2242 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2242 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76881] The complementary binding of VGAM2242 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2242 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2242 host target RNA into VGAM2242 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76882] It is appreciated that VGAM2242 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2242 host target genes. The mRNA of each one of this plurality of VGAM2242 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2242 RNA, herein designated VGAM RNA, and which when bound by VGAM2242 RNA causes inhibition of translation of respective one or more VGAM2242 host target proteins.

[76883] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2242 gene, herein designated VGAM GENE, on one or more VGAM2242 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76884] It is yet further appreciated that a function of VGAM2242

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2242 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM2242 correlate with, and may be deduced from, the identity of the host target genes which VGAM2242 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76885] Nucleotide sequences of the VGAM2242 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2242 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2242 are further described hereinbelow with reference to Table 1.

[76886] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2242 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2242 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76887] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2242 gene, herein designated VGAM is inhibition of expression of VGAM2242 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2242 correlate with, and may be deduced from, the identity of the target genes which VGAM2242 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76888] Aldehyde Dehydrogenase 1 Family, Member A3 (ALDH1A3, Accession NM_000693) is a VGAM2242 host target gene. ALDH1A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALDH1A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH1A3 BINDING SITE, designated SEQ ID:6354, to the nucleotide sequence of VGAM2242 RNA, herein designated VGAM RNA, also designated SEQ ID:4953.

[76889] A function of VGAM2242 is therefore inhibition of Aldehyde Dehydrogenase 1 Family, Member A3 (ALDH1A3, Accession NM_000693), a gene which plays a major role in the detoxification of aldehydes generated by alcohol

metabolism and lipid peroxidation. Accordingly, utilities of VGAM2242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH1A3. The function of ALDH1A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM565.Annexin A9 (ANXA9, Accession NM_003568) is another VGAM2242 host target gene. ANXA9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ANXA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANXA9 BINDING SITE, designated SEQ ID:9622, to the nucleotide sequence of VGAM2242 RNA, herein designated VGAM RNA, also designated SEQ ID:4953.

[76890] Another function of VGAM2242 is therefore inhibition of Annexin A9 (ANXA9, Accession NM_003568), a gene which aggregates and cooperatively binds anionic phospholipids and extracellular matrix proteins. Accordingly, utilities of VGAM2242 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with ANXA9. The function of ANXA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1485.Caspase Recruitment Domain Family, Member 6 (CARD6, Accession NM_032587) is another VGAM2242 host target gene. CARD6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CARD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD6 BINDING SITE, designated SEQ ID:26321, to the nucleotide sequence of VGAM2242 RNA, herein designated VGAM RNA, also designated SEQ ID:4953.

[76891] Another function of VGAM2242 is therefore inhibition of Caspase Recruitment Domain Family, Member 6 (CARD6, Accession NM_032587). Accordingly, utilities of VGAM2242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD6. DKFZp434C0923 (Accession NM_017598) is another VGAM2242 host target gene. DKFZp434C0923 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434C0923,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0923 BINDING SITE, designated SEQ ID:19062, to the nucleotide sequence of VGAM2242 RNA, herein designated VGAM RNA, also designated SEQ ID:4953.

[76892] Another function of VGAM2242 is therefore inhibition of DKFZp434C0923 (Accession NM_017598). Accordingly, utilities of VGAM2242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0923. FLJ13491 (Accession NM_024623) is another VGAM2242 host target gene. FLJ13491 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13491, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13491 BINDING SITE, designated SEQ ID:23886, to the nucleotide sequence of VGAM2242 RNA, herein designated VGAM RNA, also designated SEQ ID:4953.

[76893] Another function of VGAM2242 is therefore inhibition of FLJ13491 (Accession NM_024623). Accordingly, utilities of

VGAM2242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13491. KIAA1229 (Accession XM_030665) is another VGAM2242 host target gene. KIAA1229 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1229 BINDING SITE, designated SEQ ID:31096, to the nucleotide sequence of VGAM2242 RNA, herein designated VGAM RNA, also designated SEQ ID:4953.

[76894] Another function of VGAM2242 is therefore inhibition of KIAA1229 (Accession XM_030665). Accordingly, utilities of VGAM2242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1229. LOC157798 (Accession XM_098827) is another VGAM2242 host target gene. LOC157798 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC157798 BINDING SITE, designated SEQ ID:41853, to the nucleotide sequence of VGAM2242 RNA, herein designated VGAM RNA, also designated SEQ ID:4953.

[76895] Another function of VGAM2242 is therefore inhibition of LOC157798 (Accession XM_098827). Accordingly, utilities of VGAM2242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157798. LOC92912 (Accession XM_047970) is another VGAM2242 host target gene. LOC92912 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92912 BINDING SITE, designated SEQ ID:35083, to the nucleotide sequence of VGAM2242 RNA, herein designated VGAM RNA, also designated SEQ ID:4953.

[76896] Another function of VGAM2242 is therefore inhibition of LOC92912 (Accession XM_047970). Accordingly, utilities of VGAM2242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92912. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2243 (VGAM2243) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76897] VGAM2243 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2243 was detected is described hereinabove with reference to Figs. 1-8.

[76898] VGAM2243 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2243 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76899] VGAM2243 gene encodes a VGAM2243 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2243 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2243 precursor RNA is designated SEQ ID:2229, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2229 is located at position 19645 relative to the

genome of Porcine Epidemic Diarrhea Virus.

[76900] VGAM2243 precursor RNA folds onto itself, forming VGAM2243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76901] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2243 folded precursor RNA into VGAM2243 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2243 RNA is designated SEQ ID:4954, and is provided hereinbelow with reference to the sequence listing part.

[76902] VGAM2243 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2243 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2243 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76903] VGAM2243 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2243 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2243 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2243 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2243 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76904] The complementary binding of VGAM2243 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2243 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2243 host target RNA into VGAM2243 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76905] It is appreciated that VGAM2243 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2243 host target genes. The mRNA of each one of this plurality of VGAM2243 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2243 RNA, herein designated VGAM RNA, and which when bound by VGAM2243 RNA causes inhibition of translation of respective one or more VGAM2243 host target proteins.

[76906] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2243 gene, herein designated VGAM GENE, on one or more VGAM2243 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76907] It is yet further appreciated that a function of VGAM2243 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2243 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of

VGAM2243 correlate with, and may be deduced from, the identity of the host target genes which VGAM2243 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76908] Nucleotide sequences of the VGAM2243 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2243 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2243 are further described hereinbelow with reference to Table 1.

[76909] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2243 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2243 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76910] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2243 gene, herein designated VGAM is inhibition of expression of VGAM2243 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2243 correlate with, and may be deduced

from, the identity of the target genes which VGAM2243 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76911] Exostoses (multiple)-like 2 (EXTL2, Accession NM_001439) is a VGAM2243 host target gene. EXTL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EXTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL2 BINDING SITE, designated SEQ ID:7161, to the nucleotide sequence of VGAM2243 RNA, herein designated VGAM RNA, also designated SEQ ID:4954.

[76912] A function of VGAM2243 is therefore inhibition of Exostoses (multiple)-like 2 (EXTL2, Accession NM_001439), a gene which is homologous to the EXT and EXTL genes. Accordingly, utilities of VGAM2243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL2. The function of EXTL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM743.Leucine-rich Repeat-containing 2 (LRRC2, Accession NM_024512) is an-

other VGAM2243 host target gene. LRRC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LRRC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRC2 BINDING SITE, designated SEQ ID:23702, to the nucleotide sequence of VGAM2243 RNA, herein designated VGAM RNA, also designated SEQ ID:4954.

[76913] Another function of VGAM2243 is therefore inhibition of Leucine-rich Repeat-containing 2 (LRRC2, Accession NM_024512). Accordingly, utilities of VGAM2243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRC2. Antigen Identified By Monoclonal Antibody Ki-67 (MKI67, Accession NM_002417) is another VGAM2243 host target gene. MKI67 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MKI67, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKI67 BINDING SITE, designated SEQ ID:8253, to the nucleotide sequence of VGAM2243 RNA, herein

designated VGAM RNA, also designated SEQ ID:4954.

[76914] Another function of VGAM2243 is therefore inhibition of Antigen Identified By Monoclonal Antibody Ki-67 (MKI67, Accession NM_002417), a gene which thought to be required for maintaining cell proliferation. Accordingly, utilities of VGAM2243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKI67. The function of MKI67 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM786.HML2 (Accession NM_006344) is another VGAM2243 host target gene. HML2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HML2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HML2 BINDING SITE, designated SEQ ID:13041, to the nucleotide sequence of VGAM2243 RNA, herein designated VGAM RNA, also designated SEQ ID:4954.

[76915] Another function of VGAM2243 is therefore inhibition of HML2 (Accession NM_006344). Accordingly, utilities of VGAM2243 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with HML2. KIAA0057 (Accession NM_012288) is another VGAM2243 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:14617, to the nucleotide sequence of VGAM2243 RNA, herein designated VGAM RNA, also designated SEQ ID:4954.

[76916] Another function of VGAM2243 is therefore inhibition of KIAA0057 (Accession NM_012288). Accordingly, utilities of VGAM2243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057. LOC145757 (Accession XM_085227) is another VGAM2243 host target gene. LOC145757 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145757, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145757 BINDING SITE, designated SEQ ID:37971, to

the nucleotide sequence of VGAM2243 RNA, herein designated VGAM RNA, also designated SEQ ID:4954.

[76917] Another function of VGAM2243 is therefore inhibition of LOC145757 (Accession XM_085227). Accordingly, utilities of VGAM2243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145757. LOC149506 (Accession XM_097661) is another VGAM2243 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:41004, to the nucleotide sequence of VGAM2243 RNA, herein designated VGAM RNA, also designated SEQ ID:4954.

[76918] Another function of VGAM2243 is therefore inhibition of LOC149506 (Accession XM_097661). Accordingly, utilities of VGAM2243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2244 (VGAM2244) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76919] VGAM2244 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2244 was detected is described hereinabove with reference to Figs. 1-8.

[76920] VGAM2244 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2244 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76921] VGAM2244 gene encodes a VGAM2244 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2244 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2244 precursor RNA is designated SEQ ID:2230, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2230 is located at position 23117 relative to the genome of Porcine Epidemic Diarrhea Virus.

[76922] VGAM2244 precursor RNA folds onto itself, forming VGAM2244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76923] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2244 folded precursor RNA into VGAM2244 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2244 RNA is designated SEQ ID:4955, and is provided hereinbelow with reference to the sequence listing part.

[76924] VGAM2244 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2244 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2244 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76925] VGAM2244 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2244 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2244 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2244 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2244 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76926] The complementary binding of VGAM2244 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2244 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2244 host target RNA into VGAM2244 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76927] It is appreciated that VGAM2244 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2244 host target genes. The mRNA of each one of this plurality of VGAM2244 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2244 RNA, herein designated VGAM RNA, and which when bound by VGAM2244 RNA causes inhibition of translation of respective one or more VGAM2244 host target proteins.

[76928] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2244 gene, herein designated VGAM GENE, on one or more VGAM2244 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76929] It is yet further appreciated that a function of VGAM2244 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2244 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM2244 correlate with, and may be deduced from, the

identity of the host target genes which VGAM2244 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76930] Nucleotide sequences of the VGAM2244 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2244 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2244 are further described hereinbelow with reference to Table 1.

[76931] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2244 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2244 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76932] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2244 gene, herein designated VGAM is inhibition of expression of VGAM2244 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2244 correlate with, and may be deduced from, the identity of the target genes which VGAM2244

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76933] Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083) is a VGAM2244 host target gene. XK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XK BINDING SITE, designated SEQ ID:22060, to the nucleotide sequence of VGAM2244 RNA, herein designated VGAM RNA, also designated SEQ ID:4955.

[76934] A function of VGAM2244 is therefore inhibition of Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083). Accordingly, utilities of VGAM2244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XK. POF1B (Accession NM_024921) is another VGAM2244 host target gene. POF1B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POF1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of POF1B BINDING SITE, designated SEQ ID:24454, to the nucleotide sequence of VGAM2244 RNA, herein designated VGAM RNA, also designated SEQ ID:4955.

[76935] Another function of VGAM2244 is therefore inhibition of POF1B (Accession NM_024921). Accordingly, utilities of VGAM2244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POF1B. LOC158156 (Accession XM_088496) is another VGAM2244 host target gene. LOC158156 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158156 BINDING SITE, designated SEQ ID:39738, to the nucleotide sequence of VGAM2244 RNA, herein designated VGAM RNA, also designated SEQ ID:4955.

[76936] Another function of VGAM2244 is therefore inhibition of LOC158156 (Accession XM_088496). Accordingly, utilities of VGAM2244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158156. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2245 (VGAM2245) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76937] VGAM2245 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2245 was detected is described hereinabove with reference to Figs. 1-8.

[76938] VGAM2245 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM2245 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76939] VGAM2245 gene encodes a VGAM2245 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2245 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2245 precursor RNA is designated SEQ ID:2231, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2231 is located at position 11817 relative to the genome of Porcine Epidemic Diarrhea Virus.

[76940] VGAM2245 precursor RNA folds onto itself, forming VGAM2245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76941] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2245 folded precursor RNA into VGAM2245 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2245 RNA is designated SEQ ID:4956, and is provided hereinbelow with reference to the sequence listing part.

[76942] VGAM2245 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2245 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2245 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76943] VGAM2245 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2245 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2245 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2245 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2245 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76944] The complementary binding of VGAM2245 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2245 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2245 host target RNA into VGAM2245 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76945] It is appreciated that VGAM2245 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2245 host target genes. The mRNA of each one of this plurality of VGAM2245 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2245 RNA, herein designated VGAM RNA, and which when bound by VGAM2245 RNA causes inhibition of translation of respective one or more

VGAM2245 host target proteins.

[76946] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2245 gene, herein designated VGAM GENE, on one or more VGAM2245 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76947] It is yet further appreciated that a function of VGAM2245 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2245 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea

Virus. Specific functions, and accordingly utilities, of VGAM2245 correlate with, and may be deduced from, the identity of the host target genes which VGAM2245 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76948] Nucleotide sequences of the VGAM2245 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2245 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2245 are further described hereinbelow with reference to Table 1.

[76949] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2245 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2245 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76950] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2245 gene, herein designated VGAM is inhibition of expression of VGAM2245 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2245 correlate with, and may be deduced from, the identity of the target genes which VGAM2245 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76951] Ac-like Transposable Element (ALTE, Accession NM_004729) is a VGAM2245 host target gene. ALTE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALTE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALTE BINDING SITE, designated SEQ ID:11106, to the nucleotide sequence of VGAM2245 RNA, herein designated VGAM RNA, also designated SEQ ID:4956.

[76952] A function of VGAM2245 is therefore inhibition of Ac-like Transposable Element (ALTE, Accession NM_004729). Accordingly, utilities of VGAM2245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALTE. BCL2-associated Athanogene 2 (BAG2, Accession XM_165779) is another VGAM2245 host target gene. BAG2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BAG2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAG2 BINDING SITE, designated SEQ ID:43752, to the nucleotide sequence of VGAM2245 RNA, herein designated VGAM RNA, also designated SEQ ID:4956.

[76953] Another function of VGAM2245 is therefore inhibition of BCL2-associated Athanogene 2 (BAG2, Accession XM_165779). Accordingly, utilities of VGAM2245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG2. DKFZp547D155 (Accession XM_046977) is another VGAM2245 host target gene. DKFZp547D155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547D155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547D155 BINDING SITE, designated SEQ ID:34870, to the nucleotide sequence of VGAM2245 RNA, herein designated VGAM RNA, also designated SEQ ID:4956.

[76954] Another function of VGAM2245 is therefore inhibition of DKFZp547D155 (Accession XM_046977). Accordingly,

utilities of VGAM2245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547D155. DKFZP586A011 (Accession NM_015416) is another VGAM2245 host target gene. DKFZP586A011 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586A011, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586A011 BINDING SITE, designated SEQ ID:17717, to the nucleotide sequence of VGAM2245 RNA, herein designated VGAM RNA, also designated SEQ ID:4956.

[76955] Another function of VGAM2245 is therefore inhibition of DKFZP586A011 (Accession NM_015416). Accordingly, utilities of VGAM2245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586A011. FLJ10719 (Accession XM_031328) is another VGAM2245 host target gene. FLJ10719 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ10719 BINDING SITE, designated SEQ ID:31342, to the nucleotide sequence of VGAM2245 RNA, herein designated VGAM RNA, also designated SEQ ID:4956.

[76956] Another function of VGAM2245 is therefore inhibition of FLJ10719 (Accession XM_031328). Accordingly, utilities of VGAM2245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10719. KLK15 (Accession NM_023006) is another VGAM2245 host target gene. KLK15 BINDING SITE1 and KLK15 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KLK15, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLK15 BINDING SITE1 and KLK15 BINDING SITE2, designated SEQ ID:23266 and SEQ ID:28864 respectively, to the nucleotide sequence of VGAM2245 RNA, herein designated VGAM RNA, also designated SEQ ID:4956.

[76957] Another function of VGAM2245 is therefore inhibition of KLK15 (Accession NM_023006). Accordingly, utilities of VGAM2245 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KLK15. Stromal Cell Derived Factor Receptor 1 (SDFR1, Accession NM_012428) is another VGAM2245 host target gene. SDFR1 BINDING SITE1 and SDFR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SDFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDFR1 BINDING SITE1 and SDFR1 BINDING SITE2, designated SEQ ID:14803 and SEQ ID:18930 respectively, to the nucleotide sequence of VGAM2245 RNA, herein designated VGAM RNA, also designated SEQ ID:4956.

[76958] Another function of VGAM2245 is therefore inhibition of Stromal Cell Derived Factor Receptor 1 (SDFR1, Accession NM_012428). Accordingly, utilities of VGAM2245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDFR1. LOC146540 (Accession XM_085497) is another VGAM2245 host target gene. LOC146540 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146540 BINDING SITE, designated SEQ ID:38199, to the nucleotide sequence of VGAM2245 RNA, herein designated VGAM RNA, also designated SEQ ID:4956.

[76959] Another function of VGAM2245 is therefore inhibition of LOC146540 (Accession XM_085497). Accordingly, utilities of VGAM2245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146540. LOC152485 (Accession XM_087479) is another VGAM2245 host target gene. LOC152485 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152485 BINDING SITE, designated SEQ ID:39280, to the nucleotide sequence of VGAM2245 RNA, herein designated VGAM RNA, also designated SEQ ID:4956.

[76960] Another function of VGAM2245 is therefore inhibition of LOC152485 (Accession XM_087479). Accordingly, utilities of VGAM2245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC152485. LOC91300 (Accession XM_170568) is another VGAM2245 host target gene. LOC91300 BINDING SITE1 and LOC91300 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC91300, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91300 BINDING SITE1 and LOC91300 BINDING SITE2, designated SEQ ID:45385 and SEQ ID:29004 respectively, to the nucleotide sequence of VGAM2245 RNA, herein designated VGAM RNA, also designated SEQ ID:4956.

[76961] Another function of VGAM2245 is therefore inhibition of LOC91300 (Accession XM_170568). Accordingly, utilities of VGAM2245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91300. Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM_002570) is another VGAM2246 host target gene. PACE4 BINDING SITE1 and PACE4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PACE4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of PACE4 BINDING SITE1 and PACE4 BINDING SITE2, designated SEQ ID:8429 and SEQ ID:28718 respectively, to the nucleotide sequence of VGAM2246 RNA, herein designated VGAM RNA, also designated SEQ ID:4957.

[76962] Another function of VGAM2246 is therefore inhibition of Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM_002570), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of VGAM2246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE4. The function of PACE4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1194.Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM_000362) is another VGAM2246 host target gene. TIMP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMP3 BINDING SITE,

designated SEQ ID:5929, to the nucleotide sequence of VGAM2246 RNA, herein designated VGAM RNA, also designated SEQ ID:4957.

[76963] Another function of VGAM2246 is therefore inhibition of Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM_000362). Accordingly, utilities of VGAM2246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMP3. FLJ10620 (Accession NM_018157) is another VGAM2246 host target gene. FLJ10620 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10620 BINDING SITE, designated SEQ ID:19974, to the nucleotide sequence of VGAM2246 RNA, herein designated VGAM RNA, also designated SEQ ID:4957.

[76964] Another function of VGAM2246 is therefore inhibition of FLJ10620 (Accession NM_018157). Accordingly, utilities of VGAM2246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10620. FLJ12355 (Accession NM_024988) is another VGAM2246 host target gene. FLJ12355 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12355, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12355 BINDING SITE, designated SEQ ID:24544, to the nucleotide sequence of VGAM2246 RNA, herein designated VGAM RNA, also designated SEQ ID:4957.

[76965] Another function of VGAM2246 is therefore inhibition of FLJ12355 (Accession NM_024988). Accordingly, utilities of VGAM2246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12355. KIAA0515 (Accession XM_033380) is another VGAM2246 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31917, to the nucleotide sequence of VGAM2246 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4957.

[76966] Another function of VGAM2246 is therefore inhibition of KIAA0515 (Accession XM_033380). Accordingly, utilities of VGAM2246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. KIAA1165 (Accession XM_041162) is another VGAM2246 host target gene. KIAA1165 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1165, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1165 BINDING SITE, designated SEQ ID:33476, to the nucleotide sequence of VGAM2246 RNA, herein designated VGAM RNA, also designated SEQ ID:4957.

[76967] Another function of VGAM2246 is therefore inhibition of KIAA1165 (Accession XM_041162). Accordingly, utilities of VGAM2246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1165. LOC137964 (Accession XM_059933) is another VGAM2246 host target gene. LOC137964 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC137964, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC137964 BINDING SITE, designated SEQ ID:37109, to the nucleotide sequence of VGAM2246 RNA, herein designated VGAM RNA, also designated SEQ ID:4957.

[76968] Another function of VGAM2246 is therefore inhibition of LOC137964 (Accession XM_059933). Accordingly, utilities of VGAM2246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137964. LOC145474 (Accession XM_085147) is another VGAM2246 host target gene. LOC145474 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145474 BINDING SITE, designated SEQ ID:37868, to the nucleotide sequence of VGAM2246 RNA, herein designated VGAM RNA, also designated SEQ ID:4957.

[76969] Another function of VGAM2246 is therefore inhibition of LOC145474 (Accession XM_085147). Accordingly, utilities of VGAM2246 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145474. LOC158654 (Accession XM_088632) is another VGAM2246 host target gene. LOC158654 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158654 BINDING SITE, designated SEQ ID:39873, to the nucleotide sequence of VGAM2246 RNA, herein designated VGAM RNA, also designated SEQ ID:4957.

[76970] Another function of VGAM2246 is therefore inhibition of LOC158654 (Accession XM_088632). Accordingly, utilities of VGAM2246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158654. LOC253897 (Accession XM_171187) is another VGAM2246 host target gene. LOC253897 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253897, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253897 BINDING SITE, designated SEQ ID:45966, to

the nucleotide sequence of VGAM2246 RNA, herein designated VGAM RNA, also designated SEQ ID:4957.

[76971] Another function of VGAM2246 is therefore inhibition of LOC253897 (Accession XM_171187). Accordingly, utilities of VGAM2246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253897. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2247 (VGAM2247) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76972] VGAM2247 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2247 was detected is described hereinabove with reference to Figs. 1-8.

[76973] VGAM2247 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM2247 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76974] VGAM2247 gene encodes a VGAM2247 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2247 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2247 precursor RNA is designated SEQ ID:2233, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2233 is located at position 6648 relative to the genome of Transmissible Gastroenteritis Virus.

[76975] VGAM2247 precursor RNA folds onto itself, forming VGAM2247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76976] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2247 folded precursor RNA into VGAM2247 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2247 RNA is designated SEQ ID:4958, and is provided hereinbelow with reference to the sequence listing part.

[76977] VGAM2247 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2247 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2247 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76978] VGAM2247 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2247 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2247 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2247 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2247 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76979] The complementary binding of VGAM2247 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2247 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2247 host target RNA into VGAM2247 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76980] It is appreciated that VGAM2247 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2247 host target genes. The mRNA of each one of this plurality of VGAM2247 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2247 RNA, herein designated VGAM RNA, and which when bound by VGAM2247 RNA causes inhibition of translation of respective one or more VGAM2247 host target proteins.

[76981] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2247 gene, herein designated VGAM GENE, on one or more VGAM2247 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[76982] It is yet further appreciated that a function of VGAM2247 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2247 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM2247 correlate with, and may be deduced from, the identity of the host target genes which VGAM2247 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[76983] Nucleotide sequences of the VGAM2247 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2247 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2247 are further described hereinbelow with reference to Table 1.

[76984] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2247 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2247 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[76985] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2247 gene, herein designated VGAM is inhibition of expression of VGAM2247 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2247 correlate with, and may be deduced from, the identity of the target genes which VGAM2247 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[76986] Synaptojanin 2 (SYNJ2, Accession XM_029746) is a VGAM2247 host target gene. SYNJ2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYNJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNJ2 BINDING SITE, designated SEQ ID:30943, to the nucleotide sequence of VGAM2247 RNA, herein designated VGAM RNA, also designated SEQ ID:4958.

[76987] A function of VGAM2247 is therefore inhibition of Synaptojanin 2 (SYNJ2, Accession XM_029746). Accordingly,

utilities of VGAM2247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNJ2. LOC125704 (Accession XM_058931) is another VGAM2247 host target gene. LOC125704 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC125704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125704 BINDING SITE, designated SEQ ID:36797, to the nucleotide sequence of VGAM2247 RNA, herein designated VGAM RNA, also designated SEQ ID:4958.

[76988] Another function of VGAM2247 is therefore inhibition of LOC125704 (Accession XM_058931). Accordingly, utilities of VGAM2247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125704. LOC132321 (Accession XM_059585) is another VGAM2247 host target gene. LOC132321 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC132321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC132321 BINDING SITE, designated SEQ ID:37025, to the nucleotide sequence of VGAM2247 RNA, herein designated VGAM RNA, also designated SEQ ID:4958.

[76989] Another function of VGAM2247 is therefore inhibition of LOC132321 (Accession XM_059585). Accordingly, utilities of VGAM2247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132321. LOC219894 (Accession XM_167782) is another VGAM2247 host target gene. LOC219894 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219894 BINDING SITE, designated SEQ ID:44793, to the nucleotide sequence of VGAM2247 RNA, herein designated VGAM RNA, also designated SEQ ID:4958.

[76990] Another function of VGAM2247 is therefore inhibition of LOC219894 (Accession XM_167782). Accordingly, utilities of VGAM2247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219894. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2248 (VGAM2248) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[76991] VGAM2248 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2248 was detected is described hereinabove with reference to Figs. 1-8.

[76992] VGAM2248 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM2248 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[76993] VGAM2248 gene encodes a VGAM2248 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2248 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2248 precursor RNA is designated SEQ ID:2234, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2234 is located at position 10637 relative to the

genome of Transmissible Gastroenteritis Virus.

[76994] VGAM2248 precursor RNA folds onto itself, forming VGAM2248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[76995] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2248 folded precursor RNA into VGAM2248 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2248 RNA is designated SEQ ID:4959, and is provided hereinbelow with reference to the sequence listing part.

[76996] VGAM2248 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2248 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2248 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[76997] VGAM2248 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2248 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2248 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2248 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2248 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[76998] The complementary binding of VGAM2248 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2248 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2248 host target RNA into VGAM2248 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[76999] It is appreciated that VGAM2248 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2248 host target genes. The mRNA of each one of this plurality of VGAM2248 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2248 RNA, herein designated VGAM RNA, and which when bound by VGAM2248 RNA causes inhibition of translation of respective one or more VGAM2248 host target proteins.

[77000] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2248 gene, herein designated VGAM GENE, on one or more VGAM2248 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77001] It is yet further appreciated that a function of VGAM2248 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2248 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of

VGAM2248 correlate with, and may be deduced from, the identity of the host target genes which VGAM2248 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77002] Nucleotide sequences of the VGAM2248 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2248 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2248 are further described hereinbelow with reference to Table 1.

[77003] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2248 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2248 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77004] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2248 gene, herein designated VGAM is inhibition of expression of VGAM2248 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2248 correlate with, and may be deduced

from, the identity of the target genes which VGAM2248 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77005] KIAA0731 (Accession XM_039975) is a VGAM2248 host target gene. KIAA0731 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0731, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0731 BINDING SITE, designated SEQ ID:33238, to the nucleotide sequence of VGAM2248 RNA, herein designated VGAM RNA, also designated SEQ ID:4959.

[77006] A function of VGAM2248 is therefore inhibition of KIAA0731 (Accession XM_039975). Accordingly, utilities of VGAM2248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0731. LOC256112 (Accession XM_172829) is another VGAM2248 host target gene. LOC256112 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC256112 BINDING SITE, designated SEQ ID:46104, to the nucleotide sequence of VGAM2248 RNA, herein designated VGAM RNA, also designated SEQ ID:4959.

[77007] Another function of VGAM2248 is therefore inhibition of LOC256112 (Accession XM_172829). Accordingly, utilities of VGAM2248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256112. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2249 (VGAM2249) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77008] VGAM2249 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2249 was detected is described hereinabove with reference to Figs. 1-8.

[77009] VGAM2249 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM2249 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[77010] VGAM2249 gene encodes a VGAM2249 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2249 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2249 precursor RNA is designated SEQ ID:2235, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2235 is located at position 7046 relative to the genome of Transmissible Gastroenteritis Virus.

[77011] VGAM2249 precursor RNA folds onto itself, forming VGAM2249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77012] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2249 folded precursor RNA into VGAM2249 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2249 RNA is designated SEQ ID:4960, and is provided hereinbelow with reference to the sequence listing part.

[77013] VGAM2249 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2249 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2249 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77014] VGAM2249 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2249 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2249 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2249 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2249 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77015] The complementary binding of VGAM2249 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2249 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2249 host target RNA into VGAM2249 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77016] It is appreciated that VGAM2249 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2249 host target genes. The mRNA of each one of this plurality of VGAM2249 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2249 RNA, herein designated VGAM RNA, and which when bound by VGAM2249 RNA causes inhibition of translation of respective one or more VGAM2249 host target proteins.

[77017] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2249 gene, herein designated VGAM GENE, on one or more VGAM2249 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77018] It is yet further appreciated that a function of VGAM2249 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2249 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM2249 correlate with, and may be deduced from, the identity of the host target genes which VGAM2249 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77019] Nucleotide sequences of the VGAM2249 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2249 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2249 are further described hereinbelow with reference to Table 1.

[77020] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2249 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2249 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77021] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2249 gene, herein designated VGAM is inhibition of expression of VGAM2249 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2249 correlate with, and may be deduced from, the identity of the target genes which VGAM2249 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77022] ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052) is a VGAM2249 host target gene. ATP7A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE, designated SEQ ID:5499, to the nucleotide sequence of VGAM2249 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4960.

[77023] A function of VGAM2249 is therefore inhibition of ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052). Accordingly, utilities of VGAM2249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A. EPB72 (Accession NM_004099) is another VGAM2249 host target gene. EPB72 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPB72, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB72 BINDING SITE, designated SEQ ID:10306, to the nucleotide sequence of VGAM2249 RNA, herein designated VGAM RNA, also designated SEQ ID:4960.

[77024] Another function of VGAM2249 is therefore inhibition of EPB72 (Accession NM_004099), a gene which may regulate cation conductance. Accordingly, utilities of VGAM2249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB72. The function of EPB72 and its association with various diseases and clinical conditions, has been established by previous

studies, as described hereinabove with reference to VGAM1560.Four and A Half LIM Domains 1 (FHL1, Accession NM_001449) is another VGAM2249 host target gene. FHL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHL1 BINDING SITE, designated SEQ ID:7180, to the nucleotide sequence of VGAM2249 RNA, herein designated VGAM RNA, also designated SEQ ID:4960.

[77025] Another function of VGAM2249 is therefore inhibition of Four and A Half LIM Domains 1 (FHL1, Accession NM_001449), a gene which may have an involvement in muscle development or hypertrophy. Accordingly, utilities of VGAM2249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHL1. The function of FHL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1816.V-kit Hardy-Zuckerman 4 Feline Sarcoma Viral Oncogene Homolog (KIT, Accession NM_000222) is another VGAM2249 host target gene. KIT

BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIT BINDING SITE, designated SEQ ID:5733, to the nucleotide sequence of VGAM2249 RNA, herein designated VGAM RNA, also designated SEQ ID:4960.

[77026] Another function of VGAM2249 is therefore inhibition of V-kit Hardy-Zuckerman 4 Feline Sarcoma Viral Oncogene Homolog (KIT, Accession NM_000222), a gene which is the receptor for stem cell factor (mast cell growth factor) and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM2249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIT. The function of KIT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173.Crn, Crooked Neck-like 1 (Drosophila) (CRNKL1, Accession NM_016652) is another VGAM2249 host target gene. CRNKL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRNKL1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRNKL1 BINDING SITE, designated SEQ ID:18773, to the nucleotide sequence of VGAM2249 RNA, herein designated VGAM RNA, also designated SEQ ID:4960.

[77027] Another function of VGAM2249 is therefore inhibition of Crn, Crooked Neck-like 1 (Drosophila) (CRNKL1, Accession NM_016652). Accordingly, utilities of VGAM2249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRNKL1. DKFZp434E2220 (Accession NM_017612) is another VGAM2249 host target gene. DKFZp434E2220 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434E2220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434E2220 BINDING SITE, designated SEQ ID:19114, to the nucleotide sequence of VGAM2249 RNA, herein designated VGAM RNA, also designated SEQ ID:4960.

[77028] Another function of VGAM2249 is therefore inhibition of

DKFZp434E2220 (Accession NM_017612). Accordingly, utilities of VGAM2249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E2220. FLJ11259 (Accession NM_018370) is another VGAM2249 host target gene. FLJ11259 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11259 BINDING SITE, designated SEQ ID:20382, to the nucleotide sequence of VGAM2249 RNA, herein designated VGAM RNA, also designated SEQ ID:4960.

[77029] Another function of VGAM2249 is therefore inhibition of FLJ11259 (Accession NM_018370). Accordingly, utilities of VGAM2249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11259. FLJ14775 (Accession NM_032837) is another VGAM2249 host target gene. FLJ14775 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ14775 BINDING SITE, designated SEQ ID:26619, to the nucleotide sequence of VGAM2249 RNA, herein designated VGAM RNA, also designated SEQ ID:4960.

[77030] Another function of VGAM2249 is therefore inhibition of FLJ14775 (Accession NM_032837). Accordingly, utilities of VGAM2249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14775. LOC131873 (Accession XM_067585) is another VGAM2249 host target gene. LOC131873 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC131873, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131873 BINDING SITE, designated SEQ ID:37367, to the nucleotide sequence of VGAM2249 RNA, herein designated VGAM RNA, also designated SEQ ID:4960.

[77031] Another function of VGAM2249 is therefore inhibition of LOC131873 (Accession XM_067585). Accordingly, utilities of VGAM2249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131873. LOC255798 (Accession XM_173087) is an-

other VGAM2249 host target gene. LOC255798 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255798 BINDING SITE, designated SEQ ID:46352, to the nucleotide sequence of VGAM2249 RNA, herein designated VGAM RNA, also designated SEQ ID:4960.

[77032] Another function of VGAM2249 is therefore inhibition of LOC255798 (Accession XM_173087). Accordingly, utilities of VGAM2249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255798. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2250 (VGAM2250) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77033] VGAM2250 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2250 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[77034] VGAM2250 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM2250 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77035] VGAM2250 gene encodes a VGAM2250 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2250 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2250 precursor RNA is designated SEQ ID:2236, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2236 is located at position 14152 relative to the genome of Transmissible Gastroenteritis Virus.

[77036] VGAM2250 precursor RNA folds onto itself, forming VGAM2250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77037] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2250 folded precursor RNA into VGAM2250 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2250 RNA is designated SEQ ID:4961, and is provided hereinbelow with reference to the sequence listing part.

[77038] VGAM2250 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2250 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2250 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77039] VGAM2250 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2250 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2250 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2250 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2250 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77040] The complementary binding of VGAM2250 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2250 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2250 host target RNA into VGAM2250 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77041] It is appreciated that VGAM2250 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2250 host target genes. The mRNA of each one of this plurality of VGAM2250 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2250 RNA, herein designated VGAM RNA, and which when bound by VGAM2250 RNA causes inhibition of translation of respective one or more VGAM2250 host target proteins.

[77042] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2250 gene, herein designated VGAM GENE, on one or more VGAM2250 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77043] It is yet further appreciated that a function of VGAM2250 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2250 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM2250 correlate with, and may be deduced from, the identity of the host target genes which VGAM2250 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77044] Nucleotide sequences of the VGAM2250 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2250 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2250 are further described hereinbelow with reference to Table 1.

[77045] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2250 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2250 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77046] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2250 gene, herein designated VGAM is inhibition of expression of VGAM2250 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2250 correlate with, and may be deduced from, the identity of the target genes which VGAM2250 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77047] Optic Atrophy 1 (autosomal dominant) (OPA1, Accession NM_130833) is a VGAM2250 host target gene. OPA1 BINDING SITE1 through OPA1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OPA1, corresponding to HOST TARGET

binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPA1 BINDING SITE1 through OPA1 BINDING SITE5, designated SEQ ID:28319, SEQ ID:28327, SEQ ID:28335, SEQ ID:28343 and SEQ ID:28351 respectively, to the nucleotide sequence of VGAM2250 RNA, herein designated VGAM RNA, also designated SEQ ID:4961.

[77048] A function of VGAM2250 is therefore inhibition of Optic Atrophy 1 (autosomal dominant) (OPA1, Accession NM_130833). Accordingly, utilities of VGAM2250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPA1. KIAA1096 (Accession XM_043678) is another VGAM2250 host target gene. KIAA1096 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1096 BINDING SITE, designated SEQ ID:33996, to the nucleotide sequence of VGAM2250 RNA, herein designated VGAM RNA, also designated SEQ ID:4961.

[77049] Another function of VGAM2250 is therefore inhibition of KIAA1096 (Accession XM_043678). Accordingly, utilities of VGAM2250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1096. MGC16142 (Accession NM_032763) is another VGAM2250 host target gene. MGC16142 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC16142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16142 BINDING SITE, designated SEQ ID:26506, to the nucleotide sequence of VGAM2250 RNA, herein designated VGAM RNA, also designated SEQ ID:4961.

[77050] Another function of VGAM2250 is therefore inhibition of MGC16142 (Accession NM_032763). Accordingly, utilities of VGAM2250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16142. Protocadherin 19 (PCDH19, Accession XM_033173) is another VGAM2250 host target gene. PCDH19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDH19, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH19 BINDING SITE, designated SEQ ID:31858, to the nucleotide sequence of VGAM2250 RNA, herein designated VGAM RNA, also designated SEQ ID:4961.

[77051] Another function of VGAM2250 is therefore inhibition of Protocadherin 19 (PCDH19, Accession XM_033173). Accordingly, utilities of VGAM2250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH19. RODH-4 (Accession NM_003708) is another VGAM2250 host target gene. RODH-4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RODH-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RODH-4 BINDING SITE, designated SEQ ID:9807, to the nucleotide sequence of VGAM2250 RNA, herein designated VGAM RNA, also designated SEQ ID:4961.

[77052] Another function of VGAM2250 is therefore inhibition of RODH-4 (Accession NM_003708). Accordingly, utilities of VGAM2250 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with RODH-4. LOC145123 (Accession XM_041473) is another VGAM2250 host target gene. LOC145123 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145123 BINDING SITE, designated SEQ ID:33532, to the nucleotide sequence of VGAM2250 RNA, herein designated VGAM RNA, also designated SEQ ID:4961.

[77053] Another function of VGAM2250 is therefore inhibition of LOC145123 (Accession XM_041473). Accordingly, utilities of VGAM2250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145123. LOC147791 (Accession XM_097293) is another VGAM2250 host target gene. LOC147791 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147791, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147791 BINDING SITE, designated SEQ ID:40857, to

the nucleotide sequence of VGAM2250 RNA, herein designated VGAM RNA, also designated SEQ ID:4961.

[77054] Another function of VGAM2250 is therefore inhibition of LOC147791 (Accession XM_097293). Accordingly, utilities of VGAM2250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147791. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2251 (VGAM2251) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77055] VGAM2251 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2251 was detected is described hereinabove with reference to Figs. 1-8.

[77056] VGAM2251 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM2251 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77057] VGAM2251 gene encodes a VGAM2251 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2251 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2251 precursor RNA is designated SEQ ID:2237, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2237 is located at position 4728 relative to the genome of Transmissible Gastroenteritis Virus.

[77058] VGAM2251 precursor RNA folds onto itself, forming VGAM2251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77059] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2251 folded precursor RNA into VGAM2251 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2251 RNA is designated SEQ ID:4962, and is provided hereinbelow with reference to the sequence listing part.

[77060] VGAM2251 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2251 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2251 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77061] VGAM2251 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2251 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2251 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2251 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2251 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77062] The complementary binding of VGAM2251 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2251 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2251 host target RNA into VGAM2251 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77063] It is appreciated that VGAM2251 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2251 host target genes. The mRNA of each one of this plurality of VGAM2251 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2251 RNA, herein designated VGAM RNA, and which when bound by VGAM2251 RNA causes inhibition of translation of respective one or more VGAM2251 host target proteins.

[77064] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2251 gene, herein designated VGAM GENE, on one or more VGAM2251 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77065] It is yet further appreciated that a function of VGAM2251 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM2251 correlate with, and may be deduced from, the identity of the host target genes which VGAM2251 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77066] Nucleotide sequences of the VGAM2251 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2251 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2251 are further described hereinbelow with reference to Table 1.

[77067] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2251 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2251 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77068] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2251 gene, herein designated VGAM is inhibition of expression of VGAM2251 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2251 correlate with, and may be deduced from, the identity of the target genes which VGAM2251 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77069] Alcohol Dehydrogenase 5 (class III), Chi Polypeptide (ADH5, Accession NM_000671) is a VGAM2251 host target gene. ADH5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADH5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADH5 BINDING SITE, designated SEQ ID:6324, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77070] A function of VGAM2251 is therefore inhibition of Alcohol Dehydrogenase 5 (class III), Chi Polypeptide (ADH5, Ac-

cession NM_000671), a gene which oxidizes ethanol and activated by fatty acids.It oxidizes ethanol very poorly. Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADH5. The function of ADH5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM438.Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231) is another VGAM2251 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14886, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77071] Another function of VGAM2251 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Ac-

cordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.FBJ Murine Osteosarcoma Viral Oncogene Homolog B (FOSB, Accession NM_006732) is another VGAM2251 host target gene. FOSB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FOSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOSB BINDING SITE, designated SEQ ID:13583, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77072] Another function of VGAM2251 is therefore inhibition of FBJ Murine Osteosarcoma Viral Oncogene Homolog B (FOSB, Accession NM_006732), a gene which interacts with jun proteins enhancing their dna binding activity. Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOSB. The function of FOSB and its associ-

ation with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM747.IRTA2 (Accession NM_031281) is another VGAM2251 host target gene. IRTA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IRTA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRTA2 BINDING SITE, designated SEQ ID:25297, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77073] Another function of VGAM2251 is therefore inhibition of IRTA2 (Accession NM_031281), a gene which binds to the fc region of immunoglobulins gamma low affinity receptor. Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRTA2. The function of IRTA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Membrane Metallo-endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_007289) is an-

other VGAM2251 host target gene. MME BINDING SITE1 through MME BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MME, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MME BINDING SITE1 through MME BINDING SITE4, designated SEQ ID:14160, SEQ ID:14155, SEQ ID:14151 and SEQ ID:6603 respectively, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77074] Another function of VGAM2251 is therefore inhibition of Membrane Metallo-endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_007289), a gene which is thermolysin-like specificity. Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MME. The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1332.Polymerase (DNA directed), Theta (POLQ, Accession NM_006596) is another VGAM2251 host target gene. POLQ BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POLQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLQ BINDING SITE, designated SEQ ID:13367, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77075] Another function of VGAM2251 is therefore inhibition of Polymerase (DNA directed), Theta (POLQ, Accession NM_006596), a gene which enhances untargeted mutagenesis. Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLQ. The function of POLQ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM922.Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM_133631) is another VGAM2251 host target gene. ROBO1 BINDING SITE1 and ROBO1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ROBO1, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO1 BINDING SITE1 and ROBO1 BINDING SITE2, designated SEQ ID:28585 and SEQ ID:8849 respectively, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77076] Another function of VGAM2251 is therefore inhibition of Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM_133631), a gene which is an axon guidance receptor. Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO1. The function of ROBO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM37.Synuclein, Alpha (non A4 component of amyloid precursor) (SNCA, Accession NM_000345) is another VGAM2251 host target gene. SNCA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of SNCA BINDING SITE, designated SEQ ID:5897, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77077] Another function of VGAM2251 is therefore inhibition of Synuclein, Alpha (non A4 component of amyloid precursor) (SNCA, Accession NM_000345). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNCA. Supervillin (SVIL, Accession NM_003174) is another VGAM2251 host target gene. SVIL BINDING SITE1 and SVIL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SVIL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SVIL BINDING SITE1 and SVIL BINDING SITE2, designated SEQ ID:9150 and SEQ ID:22347 respectively, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77078] Another function of VGAM2251 is therefore inhibition of Supervillin (SVIL, Accession NM_003174), a gene which binds actin, links filamentous actin with the plasma mem-

brane; and contains putative nuclear localization signals. Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SVIL. The function of SVIL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1459.Visinin-like 1 (VSNL1, Accession NM_003385) is another VGAM2251 host target gene. VSNL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VSNL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VSNL1 BINDING SITE, designated SEQ ID:9417, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77079] Another function of VGAM2251 is therefore inhibition of Visinin-like 1 (VSNL1, Accession NM_003385). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VSNL1. ARPP-19 (Accession NM_006628) is another VGAM2251 host target gene. ARPP-19 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARPP-19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARPP-19 BINDING SITE, designated SEQ ID:13424, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77080] Another function of VGAM2251 is therefore inhibition of ARPP-19 (Accession NM_006628). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-19. Chromosome 21 Open Reading Frame 7 (C21orf7, Accession NM_020152) is another VGAM2251 host target gene. C21orf7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C21orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf7 BINDING SITE, designated SEQ ID:21362, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77081] Another function of VGAM2251 is therefore inhibition of Chromosome 21 Open Reading Frame 7 (C21orf7, Accession NM_020152). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf7. DKFZP586J0619 (Accession XM_088280) is another VGAM2251 host target gene. DKFZP586J0619 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586J0619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586J0619 BINDING SITE, designated SEQ ID:39582, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77082] Another function of VGAM2251 is therefore inhibition of DKFZP586J0619 (Accession XM_088280). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586J0619. FKSG42 (Accession NM_032032) is another VGAM2251 host target gene. FKSG42 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by FKSG42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKSG42 BINDING SITE, designated SEQ ID:25733, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77083] Another function of VGAM2251 is therefore inhibition of FKSG42 (Accession NM_032032). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKSG42. FLJ10352 (Accession NM_032142) is another VGAM2251 host target gene. FLJ10352 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10352 BINDING SITE, designated SEQ ID:25830, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77084] Another function of VGAM2251 is therefore inhibition of FLJ10352 (Accession NM_032142). Accordingly, utilities of

VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10352. FLJ20275 (Accession NM_017737) is another VGAM2251 host target gene. FLJ20275 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20275 BINDING SITE, designated SEQ ID:19321, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77085] Another function of VGAM2251 is therefore inhibition of FLJ20275 (Accession NM_017737). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20275. FLJ23074 (Accession NM_025052) is another VGAM2251 host target gene. FLJ23074 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23074

BINDING SITE, designated SEQ ID:24649, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77086] Another function of VGAM2251 is therefore inhibition of FLJ23074 (Accession NM_025052). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23074. IL22R (Accession NM_021258) is another VGAM2251 host target gene. IL22R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL22R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL22R BINDING SITE, designated SEQ ID:22235, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77087] Another function of VGAM2251 is therefore inhibition of IL22R (Accession NM_021258). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL22R. KIAA0296 (Accession NM_014699) is another VGAM2251 host target gene. KIAA0296 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by KIAA0296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0296 BINDING SITE, designated SEQ ID:16223, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77088] Another function of VGAM2251 is therefore inhibition of KIAA0296 (Accession NM_014699). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0296. KIAA0376 (Accession XM_037759) is another VGAM2251 host target gene. KIAA0376 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0376 BINDING SITE, designated SEQ ID:32676, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77089] Another function of VGAM2251 is therefore inhibition of

KIAA0376 (Accession XM_037759). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0376. M96 (Accession NM_007358) is another VGAM2251 host target gene. M96 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by M96, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M96 BINDING SITE, designated SEQ ID:14287, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77090] Another function of VGAM2251 is therefore inhibition of M96 (Accession NM_007358). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M96. mPA-PLA1 (Accession NM_139248) is another VGAM2251 host target gene. mPA-PLA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by mPA-PLA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of mPA-PLA1 BINDING SITE, designated SEQ ID:29251, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77091] Another function of VGAM2251 is therefore inhibition of mPA-PLA1 (Accession NM_139248). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with mPA-PLA1. LOC149910 (Accession XM_086699) is another VGAM2251 host target gene. LOC149910 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149910 BINDING SITE, designated SEQ ID:38829, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77092] Another function of VGAM2251 is therefore inhibition of LOC149910 (Accession XM_086699). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149910. LOC206426 (Accession XM_116505) is an-

other VGAM2251 host target gene. LOC206426 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC206426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206426 BINDING SITE, designated SEQ ID:43121, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77093] Another function of VGAM2251 is therefore inhibition of LOC206426 (Accession XM_116505). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206426. LOC220963 (Accession XM_166145) is another VGAM2251 host target gene. LOC220963 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220963 BINDING SITE, designated SEQ ID:43957, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77094] Another function of VGAM2251 is therefore inhibition of LOC220963 (Accession XM_166145). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220963. LOC91012 (Accession XM_035503) is another VGAM2251 host target gene. LOC91012 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91012 BINDING SITE, designated SEQ ID:32281, to the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, also designated SEQ ID:4962.

[77095] Another function of VGAM2251 is therefore inhibition of LOC91012 (Accession XM_035503). Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91012. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2252 (VGAM2252) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[77096] VGAM2252 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2252 was detected is described hereinabove with reference to Figs. 1-8.

[77097] VGAM2252 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM2252 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77098] VGAM2252 gene encodes a VGAM2252 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2252 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2252 precursor RNA is designated SEQ ID:2238, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2238 is located at position 9049 relative to the genome of Transmissible Gastroenteritis Virus.

[77099] VGAM2252 precursor RNA folds onto itself, forming VGAM2252 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77100] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2252 folded precursor RNA into VGAM2252 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM2252 RNA is designated SEQ ID:4963, and is provided hereinbelow with reference to the sequence listing part.

[77101] VGAM2252 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2252 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2252 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77102] VGAM2252 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2252 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2252 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2252 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2252 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77103] The complementary binding of VGAM2252 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2252 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2252 host target RNA into VGAM2252 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77104] It is appreciated that VGAM2252 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2252 host target genes. The mRNA of each one of this plurality of VGAM2252 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2252 RNA, herein designated VGAM RNA, and which when bound by VGAM2252 RNA causes inhibition of translation of respective one or more VGAM2252 host target proteins.

[77105] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2252 gene, herein designated VGAM GENE, on one or more VGAM2252 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77106] It is yet further appreciated that a function of VGAM2252 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2252 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM2252 correlate with, and may be deduced from, the identity of the host target genes which VGAM2252 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[77107] Nucleotide sequences of the VGAM2252 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2252 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2252 are further described hereinbelow with reference to Table 1.

[77108] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2252 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2252 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77109] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2252 gene, herein designated VGAM is inhibition of expression of VGAM2252 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2252 correlate with, and may be deduced from, the identity of the target genes which VGAM2252 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77110] Carnitine Acetyltransferase (CRAT, Accession NM_000755) is a VGAM2252 host target gene. CRAT BINDING SITE1 and CRAT BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CRAT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRAT BINDING SITE1 and CRAT BINDING SITE2, designated SEQ ID:6408 and SEQ ID:10153 respectively, to the nucleotide sequence of VGAM2252 RNA, herein designated VGAM RNA, also designated SEQ ID:4963.

[77111] A function of VGAM2252 is therefore inhibition of Carnitine Acetyltransferase (CRAT, Accession NM_000755), a gene which catalyzes the reversible transfer of acyl groups from an acyl-CoA thioester to carnitine. Accordingly, utilities of VGAM2252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRAT. The function of CRAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189.A Disintegrin and Metalloproteinase Domain 9 (meltrin gamma) (ADAM9, Accession NM_003816) is another VGAM2252 host target gene.

ADAM9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM9 BINDING SITE, designated SEQ ID:9906, to the nucleotide sequence of VGAM2252 RNA, herein designated VGAM RNA, also designated SEQ ID:4963.

[77112] Another function of VGAM2252 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 9 (meltrin gamma) (ADAM9, Accession NM_003816). Accordingly, utilities of VGAM2252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM9. CDV-1 (Accession NM_031473) is another VGAM2252 host target gene. CDV-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDV-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDV-1 BINDING SITE, designated SEQ ID:25540, to the nucleotide sequence of VGAM2252 RNA, herein designated VGAM RNA,

also designated SEQ ID:4963.

[77113] Another function of VGAM2252 is therefore inhibition of CDV-1 (Accession NM_031473). Accordingly, utilities of VGAM2252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDV-1. Mitogen-activated Protein Kinase 8 Interacting Protein 2 (MAPK8IP2, Accession NM_139124) is another VGAM2252 host target gene. MAPK8IP2 BINDING SITE1 through MAPK8IP2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPK8IP2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK8IP2 BINDING SITE1 through MAPK8IP2 BINDING SITE3, designated SEQ ID:29156, SEQ ID:14705 and SEQ ID:18553 respectively, to the nucleotide sequence of VGAM2252 RNA, herein designated VGAM RNA, also designated SEQ ID:4963.

[77114] Another function of VGAM2252 is therefore inhibition of Mitogen-activated Protein Kinase 8 Interacting Protein 2 (MAPK8IP2, Accession NM_139124). Accordingly, utilities of VGAM2252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MAPK8IP2. LOC221641 (Accession XM_168090) is another VGAM2252 host target gene. LOC221641 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221641 BINDING SITE, designated SEQ ID:45008, to the nucleotide sequence of VGAM2252 RNA, herein designated VGAM RNA, also designated SEQ ID:4963.

[77115] Another function of VGAM2252 is therefore inhibition of LOC221641 (Accession XM_168090). Accordingly, utilities of VGAM2252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221641. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2253 (VGAM2253) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77116] VGAM2253 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2253 was detected is described hereinabove with reference to Figs. 1-8.

[77117] VGAM2253 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM2253 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77118] VGAM2253 gene encodes a VGAM2253 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2253 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2253 precursor RNA is designated SEQ ID:2239, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2239 is located at position 2988 relative to the genome of Transmissible Gastroenteritis Virus.

[77119] VGAM2253 precursor RNA folds onto itself, forming VGAM2253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77120] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2253 folded precursor RNA into VGAM2253 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM2253 RNA is designated SEQ ID:4964, and is provided hereinbelow with reference to the sequence listing part.

[77121] VGAM2253 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2253 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2253 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77122] VGAM2253 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2253 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2253 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2253 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2253 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77123] The complementary binding of VGAM2253 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2253 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2253 host target RNA into VGAM2253 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77124] It is appreciated that VGAM2253 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2253 host target genes. The mRNA of each one of this plurality of VGAM2253 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2253 RNA, herein designated VGAM RNA, and which when bound by VGAM2253 RNA causes inhibition of translation of respective one or more VGAM2253 host target proteins.

[77125] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2253 gene, herein designated VGAM GENE, on one or more VGAM2253 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77126] It is yet further appreciated that a function of VGAM2253 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM2253 correlate with, and may be deduced from, the identity of the host target genes which VGAM2253 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77127] Nucleotide sequences of the VGAM2253 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2253 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2253 are further described hereinbelow with reference to Table 1.

[77128] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2253 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2253 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77129] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2253 gene, herein designated VGAM is inhibition of expression of VGAM2253 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2253 correlate with, and may be deduced from, the identity of the target genes which VGAM2253 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77130] A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM_007203) is a VGAM2253 host target gene. AKAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKAP2, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP2 BINDING SITE, designated SEQ ID:14064, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77131] A function of VGAM2253 is therefore inhibition of A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM_007203), a gene which binds to regulatory subunit (rii) of protein kinase a. Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP2. The function of AKAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18.Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM_001396) is another VGAM2253 host target gene. DYRK1A BINDING SITE1 through DYRK1A BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DYRK1A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DYRK1A BINDING SITE1 through DYRK1A BINDING SITE3, designated SEQ ID:7095, SEQ ID:28167 and SEQ ID:28190 respectively, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77132] Another function of VGAM2253 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM_001396), a gene which regulates cell proliferation and may be involved in brain development . Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK1A. The function of DYRK1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42.Integrin, Alpha 1 (ITGA1, Accession XM_032902) is another VGAM2253 host target gene. ITGA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA1 BINDING SITE, designated SEQ ID:31791, to the nu-

cleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77133] Another function of VGAM2253 is therefore inhibition of Integrin, Alpha 1 (ITGA1, Accession XM_032902). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA1. Latrophilin 1 (LPHH1, Accession NM_012302) is another VGAM2253 host target gene. LPHH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LPHH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPHH1 BINDING SITE, designated SEQ ID:14670, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77134] Another function of VGAM2253 is therefore inhibition of Latrophilin 1 (LPHH1, Accession NM_012302), a gene which probably involved in cell adhesion within tissues and receptor signalling. Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPHH1.

The function of LPHH1 has been established by previous studies. In a study of breast tumor samples, Hoggard et al. (1995) reported a region, 1p31.1, with a high frequency of loss of heterozygosity (LOH). In order to identify candidate sequences, mutation of which might contribute to the development of breast cancer, White et al. (1998) carried out mapping studies of ESTs localized to 1p31.1. They identified and characterized a novel gene, LPHH1 (latrophilin homolog-1), located adjacent to the smallest region of overlapping loss seen in tumors. The 4,209-bp open reading frame of the 7-kb LPHH1 transcript encoded a peptide that showed approximately 65% identity to rat latrophilin, a G-coupled, 7-span transmembrane protein that binds alpha-latrotoxin. Surprisingly, while expression of the rat gene was strictly restricted to neurologic and perhaps some endocrine cells, the human sequence appeared to be expressed very widely in all normal tissues tested. The range of transcripts encoded in a breast tumor cell line, compared to normal breast, suggested that gene product variability was higher in the tumor

[77135] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[77136] Hoggard, N.; Brintell, B.; Howell, A.; Weissenbach, J.; Varley, J. : Allelic imbalance on chromosome 1 in human breast cancer. II. Microsatellite repeat analysis. Genes Chromosomes Cancer 12: 24-31, 1995. ; and

[77137] White, G. R. M.; Varley, J. M.; Heighway, J. : Isolation and characterization of a human homologue of the latrophilin gene from a region of 1p31.1 implicated in breast cancer. Oncogene 17:.

[77138] Further studies establishing the function and utilities of LPHH1 are found in John Hopkins OMIM database record ID 607018, and in sited publications numbered 5377-5378 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 2 (MAP3K7IP2, Accession NM_015093) is another VGAM2253 host target gene. MAP3K7IP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K7IP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K7IP2 BINDING SITE, designated SEQ ID:17487, to the nucleotide sequence of VGAM2253 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4964.

[77139] Another function of VGAM2253 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 2 (MAP3K7IP2, Accession NM_015093). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K7IP2. AD-020 (Accession XM_002161) is another VGAM2253 host target gene. AD-020 BINDING SITE1 and AD-020 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AD-020, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AD-020 BINDING SITE1 and AD-020 BINDING SITE2, designated SEQ ID:29871 and SEQ ID:21341 respectively, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77140] Another function of VGAM2253 is therefore inhibition of AD-020 (Accession XM_002161). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD-020. FLJ11101 (Accession NM_018322) is another

VGAM2253 host target gene. FLJ11101 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11101 BINDING SITE, designated SEQ ID:20314, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77141] Another function of VGAM2253 is therefore inhibition of FLJ11101 (Accession NM_018322). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11101. FLJ21144 (Accession NM_022774) is another VGAM2253 host target gene. FLJ21144 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21144, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21144 BINDING SITE, designated SEQ ID:23038, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77142] Another function of VGAM2253 is therefore inhibition of FLJ21144 (Accession NM_022774). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21144. UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 6 (GalNAc-T6) (GALNT6, Accession NM_007210) is another VGAM2253 host target gene. GALNT6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GALNT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT6 BINDING SITE, designated SEQ ID:14073, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77143] Another function of VGAM2253 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 6 (GalNAc-T6) (GALNT6, Accession NM_007210). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

GALNT6. KIAA1240 (Accession XM_039676) is another VGAM2253 host target gene. KIAA1240 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1240 BINDING SITE, designated SEQ ID:33144, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77144] Another function of VGAM2253 is therefore inhibition of KIAA1240 (Accession XM_039676). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1240. MGC22014 (Accession XM_035307) is another VGAM2253 host target gene. MGC22014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC22014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:32224, to the nucleotide sequence of VGAM2253 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4964.

[77145] Another function of VGAM2253 is therefore inhibition of MGC22014 (Accession XM_035307). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22014. LOC143173 (Accession XM_016685) is another VGAM2253 host target gene. LOC143173 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143173 BINDING SITE, designated SEQ ID:30272, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77146] Another function of VGAM2253 is therefore inhibition of LOC143173 (Accession XM_016685). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143173. LOC149722 (Accession XM_097709) is another VGAM2253 host target gene. LOC149722 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149722, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149722 BINDING SITE, designated SEQ ID:41043, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77147] Another function of VGAM2253 is therefore inhibition of LOC149722 (Accession XM_097709). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149722. LOC152627 (Accession XM_087495) is another VGAM2253 host target gene. LOC152627 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152627 BINDING SITE, designated SEQ ID:39295, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77148] Another function of VGAM2253 is therefore inhibition of LOC152627 (Accession XM_087495). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC152627. LOC257482 (Accession XM_168544) is another VGAM2253 host target gene. LOC257482 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257482 BINDING SITE, designated SEQ ID:45233, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77149] Another function of VGAM2253 is therefore inhibition of LOC257482 (Accession XM_168544). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257482. LOC257485 (Accession XM_037746) is another VGAM2253 host target gene. LOC257485 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257485 BINDING SITE, designated SEQ ID:32670, to

the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77150] Another function of VGAM2253 is therefore inhibition of LOC257485 (Accession XM_037746). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257485. LOC90670 (Accession XM_033352) is another VGAM2253 host target gene. LOC90670 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90670, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90670 BINDING SITE, designated SEQ ID:31883, to the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, also designated SEQ ID:4964.

[77151] Another function of VGAM2253 is therefore inhibition of LOC90670 (Accession XM_033352). Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90670. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2254 (VGAM2254) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77152] VGAM2254 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2254 was detected is described hereinabove with reference to Figs. 1-8.

[77153] VGAM2254 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM2254 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77154] VGAM2254 gene encodes a VGAM2254 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2254 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2254 precursor RNA is designated SEQ ID:2240, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2240 is located at position 9818 relative to the genome of Transmissible Gastroenteritis Virus.

[77155] VGAM2254 precursor RNA folds onto itself, forming VGAM2254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77156] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2254 folded precursor RNA into VGAM2254 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2254 RNA is designated SEQ ID:4965, and is provided hereinbelow with reference to the sequence listing part.

[77157] VGAM2254 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2254 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2254 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77158] VGAM2254 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2254 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2254 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2254 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2254 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77159] The complementary binding of VGAM2254 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2254 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2254 host target RNA into VGAM2254 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77160] It is appreciated that VGAM2254 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2254 host target genes. The mRNA of each one of this plurality of VGAM2254 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2254 RNA, herein designated VGAM RNA, and which when bound by VGAM2254 RNA causes inhibition of translation of respective one or more VGAM2254 host target proteins.

[77161] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2254 gene, herein designated VGAM GENE, on one or more VGAM2254 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77162] It is yet further appreciated that a function of VGAM2254 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM2254 correlate with, and may be deduced from, the

identity of the host target genes which VGAM2254 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77163] Nucleotide sequences of the VGAM2254 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2254 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2254 are further described hereinbelow with reference to Table 1.

[77164] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2254 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2254 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77165] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2254 gene, herein designated VGAM is inhibition of expression of VGAM2254 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2254 correlate with, and may be deduced from, the identity of the target genes which VGAM2254

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77166] Acid Phosphatase, Testicular (ACPT, Accession NM_080789) is a VGAM2254 host target gene. ACPT BINDING SITE1 and ACPT BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ACPT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACPT BINDING SITE1 and ACPT BINDING SITE2, designated SEQ ID:28045 and SEQ ID:28048 respectively, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77167] A function of VGAM2254 is therefore inhibition of Acid Phosphatase, Testicular (ACPT, Accession NM_080789). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACPT. Capping Protein (actin filament) Muscle Z-line, Alpha 1 (CAPZA1, Accession XM_052116) is another VGAM2254 host target gene. CAPZA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

CAPZA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPZA1 BINDING SITE, designated SEQ ID:35951, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77168] Another function of VGAM2254 is therefore inhibition of Capping Protein (actin filament) Muscle Z-line, Alpha 1 (CAPZA1, Accession XM_052116), a gene which is alpha 1 subunit of actin filament capping protein; binds actin, has roles in cell motility and actin assembly. Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPZA1. The function of CAPZA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM547.V-erb-a Erythroblastic Leukemia Viral Oncogene Homolog 4 (avian) (ERBB4, Accession NM_005235) is another VGAM2254 host target gene. ERBB4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ERBB4, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERBB4 BINDING SITE, designated SEQ ID:11745, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77169] Another function of VGAM2254 is therefore inhibition of V-erb-a Erythroblastic Leukemia Viral Oncogene Homolog 4 (avian) (ERBB4, Accession NM_005235), a gene which may function in growth/differentiation of normal and transformed cells. Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERBB4. The function of ERBB4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231) is another VGAM2254 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14885, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77170] Another function of VGAM2254 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM_000620) is another VGAM2254 host target gene. NOS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NOS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOS1 BINDING SITE, designated SEQ ID:6235, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4965.

[77171] Another function of VGAM2254 is therefore inhibition of Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM_000620), a gene which produces nitric oxide (no) which is a messenger molecule with diverse functions throughout the body. Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOS1. The function of NOS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615) is another VGAM2254 host target gene. SLC4A7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC4A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A7 BINDING SITE, designated SEQ ID:9670, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77172] Another function of VGAM2254 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615), a gene which mediates the coupled movement of sodium and bicarbonate ions across the plasma membrane. Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A7. The function of SLC4A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM66.Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM_114191) is another VGAM2254 host target gene. C21orf108 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C21orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf108 BINDING SITE, designated SEQ ID:42769, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77173] Another function of VGAM2254 is therefore inhibition of

Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM_114191). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf108. DKFZp434C0328 (Accession NM_017577) is another VGAM2254 host target gene. DKFZp434C0328 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434C0328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0328 BINDING SITE, designated SEQ ID:19011, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77174] Another function of VGAM2254 is therefore inhibition of DKFZp434C0328 (Accession NM_017577). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0328. FLJ10971 (Accession NM_018287) is another VGAM2254 host target gene. FLJ10971 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10971, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10971 BINDING SITE, designated SEQ ID:20280, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77175] Another function of VGAM2254 is therefore inhibition of FLJ10971 (Accession NM_018287). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10971. FLJ13397 (Accession NM_024948) is another VGAM2254 host target gene. FLJ13397 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13397 BINDING SITE, designated SEQ ID:24500, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77176] Another function of VGAM2254 is therefore inhibition of FLJ13397 (Accession NM_024948). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13397. FLJ14249 (Accession NM_106552) is another VGAM2254 host target gene. FLJ14249 BINDING SITE1 and FLJ14249 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ14249, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14249 BINDING SITE1 and FLJ14249 BINDING SITE2, designated SEQ ID:28171 and SEQ ID:22801 respectively, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77177] Another function of VGAM2254 is therefore inhibition of FLJ14249 (Accession NM_106552). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14249. KIAA1361 (Accession XM_030845) is another VGAM2254 host target gene. KIAA1361 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1361 BINDING SITE, designated SEQ ID:31168, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77178] Another function of VGAM2254 is therefore inhibition of KIAA1361 (Accession XM_030845). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1361. Karyopherin Alpha 6 (importin alpha 7) (KPNA6, Accession NM_012316) is another VGAM2254 host target gene. KPNA6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KPNA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KPNA6 BINDING SITE, designated SEQ ID:14689, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77179] Another function of VGAM2254 is therefore inhibition of Karyopherin Alpha 6 (importin alpha 7) (KPNA6, Accession NM_012316). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with KPNA6. Neuromedin U Receptor 2 (NMU2R, Accession NM_020167) is another VGAM2254 host target gene. NMU2R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NMU2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NMU2R BINDING SITE, designated SEQ ID:21385, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77180] Another function of VGAM2254 is therefore inhibition of Neuromedin U Receptor 2 (NMU2R, Accession NM_020167). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NMU2R. RAB14, Member RAS Oncogene Family (RAB14, Accession NM_016322) is another VGAM2254 host target gene. RAB14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB14 BIND-

ING SITE, designated SEQ ID:18447, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77181] Another function of VGAM2254 is therefore inhibition of RAB14, Member RAS Oncogene Family (RAB14, Accession NM_016322). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB14. T-box 19 (TBX19, Accession NM_005149) is another VGAM2254 host target gene. TBX19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBX19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBX19 BINDING SITE, designated SEQ ID:11624, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77182] Another function of VGAM2254 is therefore inhibition of T-box 19 (TBX19, Accession NM_005149). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX19. LOC129831 (Accession XM_059376) is an-

other VGAM2254 host target gene. LOC129831 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC129831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129831 BINDING SITE, designated SEQ ID:36981, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77183] Another function of VGAM2254 is therefore inhibition of LOC129831 (Accession XM_059376). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129831. LOC146545 (Accession XM_085501) is another VGAM2254 host target gene. LOC146545 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146545 BINDING SITE, designated SEQ ID:38201, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77184] Another function of VGAM2254 is therefore inhibition of LOC146545 (Accession XM_085501). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146545. LOC149111 (Accession XM_086429) is another VGAM2254 host target gene. LOC149111 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149111 BINDING SITE, designated SEQ ID:38648, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77185] Another function of VGAM2254 is therefore inhibition of LOC149111 (Accession XM_086429). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149111. LOC152897 (Accession XM_087555) is another VGAM2254 host target gene. LOC152897 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152897, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152897 BINDING SITE, designated SEQ ID:39327, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77186] Another function of VGAM2254 is therefore inhibition of LOC152897 (Accession XM_087555). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152897. LOC199676 (Accession XM_117107) is another VGAM2254 host target gene. LOC199676 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199676 BINDING SITE, designated SEQ ID:43225, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77187] Another function of VGAM2254 is therefore inhibition of LOC199676 (Accession XM_117107). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC199676. LOC221814 (Accession XM_168226) is another VGAM2254 host target gene. LOC221814 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221814 BINDING SITE, designated SEQ ID:45093, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77188] Another function of VGAM2254 is therefore inhibition of LOC221814 (Accession XM_168226). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221814. LOC253868 (Accession XM_170975) is another VGAM2254 host target gene. LOC253868 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253868 BINDING SITE, designated SEQ ID:45750, to the nucleotide sequence of VGAM2254 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4965.

[77189] Another function of VGAM2254 is therefore inhibition of LOC253868 (Accession XM_170975). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253868. LOC255515 (Accession XM_171185) is another VGAM2254 host target gene. LOC255515 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255515 BINDING SITE, designated SEQ ID:45961, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77190] Another function of VGAM2254 is therefore inhibition of LOC255515 (Accession XM_171185). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255515. LOC56181 (Accession XM_170954) is another VGAM2254 host target gene. LOC56181 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC56181, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56181 BINDING SITE, designated SEQ ID:45740, to the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, also designated SEQ ID:4965.

[77191] Another function of VGAM2254 is therefore inhibition of LOC56181 (Accession XM_170954). Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56181. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2255 (VGAM2255) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77192] VGAM2255 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2255 was detected is described hereinabove with reference to Figs. 1-8.

[77193] VGAM2255 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroen-

teritis Virus. VGAM2255 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77194] VGAM2255 gene encodes a VGAM2255 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2255 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2255 precursor RNA is designated SEQ ID:2241, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2241 is located at position 11215 relative to the genome of Transmissible Gastroenteritis Virus.

[77195] VGAM2255 precursor RNA folds onto itself, forming VGAM2255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77196] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2255 folded precursor RNA into VGAM2255 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2255 RNA is designated SEQ ID:4966, and is provided hereinbelow with reference to the sequence listing part.

[77197] VGAM2255 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2255 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2255 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77198] VGAM2255 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2255 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2255 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2255 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2255 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77199] The complementary binding of VGAM2255 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2255 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2255 host target RNA into VGAM2255 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77200] It is appreciated that VGAM2255 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2255 host target genes. The mRNA of each one of this plurality of VGAM2255 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2255 RNA, herein designated VGAM RNA, and which when bound by VGAM2255 RNA causes inhibition of translation of respective one or more VGAM2255 host target proteins.

[77201] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2255 gene, herein designated VGAM GENE, on one or more VGAM2255 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77202] It is yet further appreciated that a function of VGAM2255 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2255 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM2255 correlate with, and may be deduced from, the identity of the host target genes which VGAM2255 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77203] Nucleotide sequences of the VGAM2255 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2255 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2255 are further described hereinbelow with reference to Table 1.

[77204] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2255 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2255 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77205] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2255 gene, herein designated VGAM is inhibition of expression of VGAM2255 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2255 correlate with, and may be deduced from, the identity of the target genes which VGAM2255 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77206] Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180) is a VGAM2255 host target gene. NTRK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NTRK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTRK2 BINDING SITE, designated SEQ

ID:12849, to the nucleotide sequence of VGAM2255 RNA, herein designated VGAM RNA, also designated SEQ ID:4966.

[77207] A function of VGAM2255 is therefore inhibition of Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180), a gene which is involved in the development and/or maintenance of the nervous system. Accordingly, utilities of VGAM2255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTRK2. The function of NTRK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM_003326) is another VGAM2255 host target gene. TNFSF4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFSF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF4 BINDING SITE, designated SEQ ID:9329, to the nucleotide sequence of

VGAM2255 RNA, herein designated VGAM RNA, also designated SEQ ID:4966.

[77208] Another function of VGAM2255 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM_003326), a gene which co-stimulates t cell proliferation and cytokine production. Accordingly, utilities of VGAM2255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF4. The function of TNFSF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM463.FLJ10352 (Accession NM_032142) is another VGAM2255 host target gene. FLJ10352 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10352 BINDING SITE, designated SEQ ID:25829, to the nucleotide sequence of VGAM2255 RNA, herein designated VGAM RNA, also designated SEQ ID:4966.

[77209] Another function of VGAM2255 is therefore inhibition of FLJ10352 (Accession NM_032142). Accordingly, utilities of VGAM2255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10352. JIK (Accession NM_016281) is another VGAM2255 host target gene. JIK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by JIK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JIK BINDING SITE, designated SEQ ID:18407, to the nucleotide sequence of VGAM2255 RNA, herein designated VGAM RNA, also designated SEQ ID:4966.

[77210] Another function of VGAM2255 is therefore inhibition of JIK (Accession NM_016281). Accordingly, utilities of VGAM2255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JIK. LOC115574 (Accession XM_056240) is another VGAM2255 host target gene. LOC115574 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115574, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115574 BINDING SITE, designated SEQ ID:36366, to the nucleotide sequence of VGAM2255 RNA, herein designated VGAM RNA, also designated SEQ ID:4966.

[77211] Another function of VGAM2255 is therefore inhibition of LOC115574 (Accession XM_056240). Accordingly, utilities of VGAM2255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115574. LOC149711 (Accession XM_097720) is another VGAM2255 host target gene. LOC149711 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, designated SEQ ID:41072, to the nucleotide sequence of VGAM2255 RNA, herein designated VGAM RNA, also designated SEQ ID:4966.

[77212] Another function of VGAM2255 is therefore inhibition of LOC149711 (Accession XM_097720). Accordingly, utilities of VGAM2255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC149711. LOC149837 (Accession XM_097747) is another VGAM2255 host target gene. LOC149837 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE, designated SEQ ID:41100, to the nucleotide sequence of VGAM2255 RNA, herein designated VGAM RNA, also designated SEQ ID:4966.

[77213] Another function of VGAM2255 is therefore inhibition of LOC149837 (Accession XM_097747). Accordingly, utilities of VGAM2255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837. LOC220766 (Accession XM_165471) is another VGAM2255 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:43650, to the nucleotide sequence of VGAM2255 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4966.

[77214] Another function of VGAM2255 is therefore inhibition of LOC220766 (Accession XM_165471). Accordingly, utilities of VGAM2255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC221272 (Accession XM_168050) is another VGAM2255 host target gene. LOC221272 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221272 BINDING SITE, designated SEQ ID:44965, to the nucleotide sequence of VGAM2255 RNA, herein designated VGAM RNA, also designated SEQ ID:4966.

[77215] Another function of VGAM2255 is therefore inhibition of LOC221272 (Accession XM_168050). Accordingly, utilities of VGAM2255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221272. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2256 (VGAM2256) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77216] VGAM2256 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2256 was detected is described hereinabove with reference to Figs. 1-8.

[77217] VGAM2256 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Oat Chlorotic Stunt Virus. VGAM2256 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77218] VGAM2256 gene encodes a VGAM2256 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2256 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2256 precursor RNA is designated SEQ ID:2242, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2242 is located at position 1813 relative to the genome of Oat Chlorotic Stunt Virus.

[77219] VGAM2256 precursor RNA folds onto itself, forming

VGAM2256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77220] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2256 folded precursor RNA into VGAM2256 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2256 RNA is designated SEQ ID:4967, and is provided hereinbelow with reference to the sequence listing part.

[77221] VGAM2256 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2256 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2256 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77222] VGAM2256 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2256 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2256 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2256 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2256 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77223] The complementary binding of VGAM2256 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2256 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2256 host target RNA into VGAM2256 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77224] It is appreciated that VGAM2256 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2256 host target genes. The mRNA of each one of this plurality of VGAM2256 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2256 RNA, herein designated VGAM RNA, and which when bound by VGAM2256 RNA causes inhibition of translation of respective one or more VGAM2256 host target proteins.

[77225] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2256 gene, herein designated VGAM GENE, on one or more VGAM2256 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77226] It is yet further appreciated that a function of VGAM2256 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2256 include diagnosis, prevention and treatment of viral infection by Oat Chlorotic Stunt Virus. Specific functions, and accordingly utilities, of VGAM2256 correlate with, and may be deduced from, the identity of the host target genes which VGAM2256 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[77227] Nucleotide sequences of the VGAM2256 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2256 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2256 are further described hereinbelow with reference to Table 1.

[77228] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2256 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2256 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77229] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2256 gene, herein designated VGAM is inhibition of expression of VGAM2256 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2256 correlate with, and may be deduced from, the identity of the target genes which VGAM2256 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[77230] FAT Tumor Suppressor Homolog 2 (Drosophila) (FAT2, Accession NM_001447) is a VGAM2256 host target gene. FAT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAT2 BINDING SITE, designated SEQ ID:7172, to the nucleotide sequence of VGAM2256 RNA, herein designated VGAM RNA, also designated SEQ ID:4967.

[77231] A function of VGAM2256 is therefore inhibition of FAT Tumor Suppressor Homolog 2 (Drosophila) (FAT2, Accession NM_001447), a gene which could function as a cell-adhesion protein. Accordingly, utilities of VGAM2256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAT2. The function of FAT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM949.KIAA0930 (Accession XM_047214) is another VGAM2256 host target gene. KIAA0930 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA0930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0930 BINDING SITE, designated SEQ ID:34913, to the nucleotide sequence of VGAM2256 RNA, herein designated VGAM RNA, also designated SEQ ID:4967.

[77232] Another function of VGAM2256 is therefore inhibition of KIAA0930 (Accession XM_047214). Accordingly, utilities of VGAM2256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0930. Peptidyl Arginine Deiminase, Type I (PADI1, Accession XM_030498) is another VGAM2256 host target gene. PADI1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PADI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PADI1 BINDING SITE, designated SEQ ID:31054, to the nucleotide sequence of VGAM2256 RNA, herein designated VGAM RNA, also designated SEQ ID:4967.

[77233] Another function of VGAM2256 is therefore inhibition of

Peptidyl Arginine Deiminase, Type I (PADI1, Accession XM_030498). Accordingly, utilities of VGAM2256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PADI1. LOC144600 (Accession XM_096639) is another VGAM2256 host target gene. LOC144600 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144600 BINDING SITE, designated SEQ ID:40446, to the nucleotide sequence of VGAM2256 RNA, herein designated VGAM RNA, also designated SEQ ID:4967.

[77234] Another function of VGAM2256 is therefore inhibition of LOC144600 (Accession XM_096639). Accordingly, utilities of VGAM2256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144600. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2257 (VGAM2257) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[77235] VGAM2257 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2257 was detected is described hereinabove with reference to Figs. 1-8.

[77236] VGAM2257 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Oat Chlorotic Stunt Virus. VGAM2257 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77237] VGAM2257 gene encodes a VGAM2257 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2257 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2257 precursor RNA is designated SEQ ID:2243, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2243 is located at position 987 relative to the genome of Oat Chlorotic Stunt Virus.

[77238] VGAM2257 precursor RNA folds onto itself, forming VGAM2257 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77239] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2257 folded precursor RNA into VGAM2257 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2257 RNA is designated SEQ ID:4968, and is provided hereinbelow with reference to the sequence listing part.

[77240] VGAM2257 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2257 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2257 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77241] VGAM2257 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2257 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2257 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2257 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2257 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77242] The complementary binding of VGAM2257 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2257 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2257 host target RNA into VGAM2257 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77243] It is appreciated that VGAM2257 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2257 host target genes. The mRNA of each one of this plurality of VGAM2257 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2257 RNA, herein designated VGAM RNA, and which when bound by VGAM2257 RNA causes inhibition of translation of respective one or more VGAM2257 host target proteins.

[77244] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2257 gene, herein designated VGAM GENE, on one or more VGAM2257 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77245] It is yet further appreciated that a function of VGAM2257 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of viral infection by Oat Chlorotic Stunt Virus. Specific functions, and accordingly utilities, of VGAM2257 correlate with, and may be deduced from, the identity of the host target genes which VGAM2257 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[77246] Nucleotide sequences of the VGAM2257 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2257 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2257 are further described hereinbelow with reference to Table 1.

[77247] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2257 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2257 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77248] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2257 gene, herein designated VGAM is inhibition of expression of VGAM2257 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2257 correlate with, and may be deduced from, the identity of the target genes which VGAM2257 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77249] Cholinergic Receptor, Muscarinic 1 (CHRM1, Accession XM_170669) is a VGAM2257 host target gene. CHRM1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CHRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRM1 BINDING SITE, designated SEQ ID:45441, to the nucleotide sequence of VGAM2257 RNA, herein designated VGAM RNA, also designated SEQ ID:4968.

[77250] A function of VGAM2257 is therefore inhibition of Cholinergic Receptor, Muscarinic 1 (CHRM1, Accession XM_170669), a gene which mediates various cellular responses. Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRM1. The function of CHRM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM302.Ficolin (collagen/fibrinogen domain containing lectin) 2 (hucolin) (FCN2, Accession NM_015839) is another VGAM2257 host target gene. FCN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FCN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCN2 BINDING SITE, designated SEQ ID:17954, to the nucleotide sequence of VGAM2257 RNA, herein designated VGAM RNA, also designated SEQ ID:4968.

[77251] Another function of VGAM2257 is therefore inhibition of Ficolin (collagen/fibrinogen domain containing lectin) 2 (hucolin) (FCN2, Accession NM_015839), a gene which is involved in phagocytosis of pathogens. Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCN2. The function of FCN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM493.Mitogen-activated Protein Kinase Kinase Kinase 8 (MAP3K8, Accession NM_005204) is another VGAM2257 host target gene. MAP3K8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAP3K8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of MAP3K8 BINDING SITE, designated SEQ ID:11706, to the nucleotide sequence of VGAM2257 RNA, herein designated VGAM RNA, also designated SEQ ID:4968.

[77252] Another function of VGAM2257 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 8 (MAP3K8, Accession NM_005204), a gene which is able to activate nf-kappa-b 1 by stimulating proteasome- mediated p. Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K8. The function of MAP3K8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM32.Protocadherin 9 (PCDH9, Accession XM_096054) is another VGAM2257 host target gene. PCDH9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCDH9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH9 BINDING SITE, designated SEQ ID:40296, to the nucleotide sequence of VGAM2257 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4968.
